About this manual

This manual describes the product application and explains how to work and use it major features. It serves as a means to describe the user interface and how to use it to accomplish common tasks. This manual also describes the underlying assumptions and users make the underlying data model.

Document Conventions

In this manual, certain words are represented in different fonts, typefaces, sizes, and weights. This highlighting is systematic; different words are represented in the same style to indicate their inclusion in a specific category. Additionally, this document has different strategies to draw User attention to certain pieces of information. In order of how critical the information is to your system, these items are marked as a note, tip, important, caution, or warning.

Icon	Purpose

	**Note**
	**Tip/Best Practice**
	**Important**
	**Caution**
	**Warning**

- **Bold** indicates the name of the menu items, options, dialog boxes, windows and functions.
- The color blue with underline is used to indicate cross-references and hyperlinks.
- Numbered Paragraphs - Numbered paragraphs are used to indicate tasks that need to be carried out. Text in paragraphs without numbering represents ordinary information.
- The Courier font indicates a command sequence, file type, URL, Folder/File name

Introduction

1. Introduction

1.1. Overview

This User manual describes the steps involved in setting up the SIP Threat Manager Appliance. This appliance is based VoIP threat prevention solution dedicated to protect the SIP based PBX/Telecom Gateway/IP Phones/Mobile device deployments. The appliance runs the Real time Deep Packet Inspection on the SIP traffic to identify the VOIP attack vectors and prevents the threats impacting the SIP based devices. The appliance has been made to seamlessly integrate with the existing network infrastructure and reduces the complexity of deployment.

The appliance feature set includes,

- Analyze SIP packets using the Real-time Deep Packet inspection engine.
- SIP Protocol Anomaly detection with configurability of detection parameters.
- Detection and Prevention of the following categories of SIP based Attacks.
  - Reconnaissance attacks (SIP Devices Fingerprinting, User enumeration, Password Cracking Attempt)
  - Dos/DDos Attacks
  - Cross Site Scripting based attacks.
  - Buffer overflow attacks
  - SIP Anomaly based attacks
  - 3rd Party vendor vulnerabilities
  - Toll Fraud detection and prevention
  - Protection against VOIP Spam & War Dialing

- Attack response includes the option for quietly dropping malicious SIP packets to help prevent continued attacks
- Dynamic Blacklist Update service for VOIP, SIP PBX/Gateway Threats
- Configurability of Blacklist/White list/Firewall rules.
- Support for Geo Location based blocking.
- Provide the option to secure against PBX Application vulnerabilities
- Operate at Layer 2 device thus transparent to existing IP infrastructure - no changes required to add the device to your existing network
- Web/SSL based Device Management Access which will allow managing the device anywhere from the Cloud.
- Ability to restrict the device management access to specific IP/Network.
- Provide System Status/Security events logging option to a remote Syslog server.
- Provides the SIP throughput up to ~10Mbps.
- Support for Signature update subscription and automated signature update mechanism.
- The device has been made to operate with default configuration with just powering on the device. No administrator intervention is required to operate the device with default configuration.
- USB based power supply
- Optional support for security events logging on the USB based storage.

Technical Specifications

Functional Mode	Transparent Firewall with SIP Deep Packet Engine.
SIP Intrusion/Prevention	~400+ SIP Attack Signatures Support
Throughput	~10Mbps
No of concurrent calls supports	Up to 50 concurrent calls
Logging	Local Security Event Console, Remote Syslog
Device Management	Web GUI via Https & SSH CLI
Hardware	MIPS based 32bit Processor Single core, 300MHz
Primary Storage	16 MB Flash
RAM	64MB
Secondary Storage	USB Storage devices support for logging (Optional)

Interfaces	Two Fast Ethernet Interfaces.

1.2. Notification LEDs (On the Front Panel of the SIP Firewall)

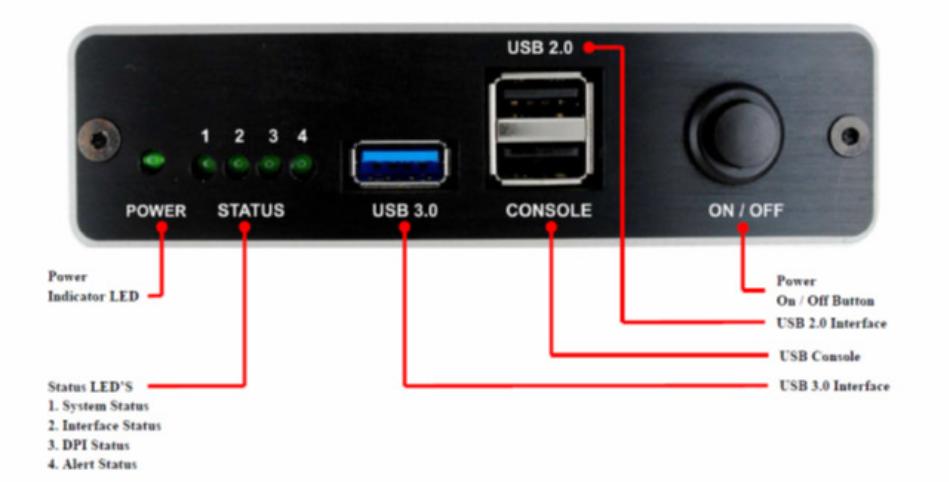

Figure 1: Front Panel LED Notifications

The SIP Firewall package includes:

- 1 SIP Firewall Appliance
- 1 USB Power Adapter
- 1 Serial Console Cable
- 2 Ethernet Cables

1.3. SIP Firewall Rear View:

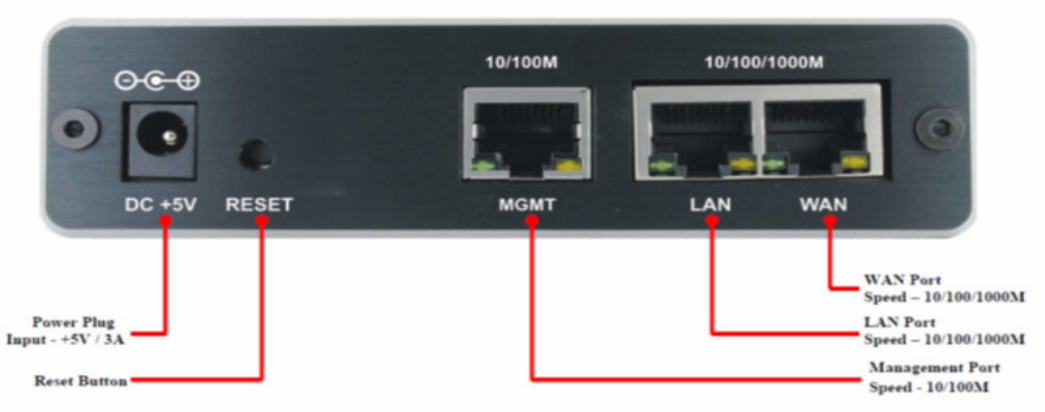

Figure 2: SIP Firewall Rear View

1.4. SIP Firewall Deployment Considerations

The SIP Firewall has been made to protect the SIP based PBX/Gateway Servers against SIP based network threats and anomalies. Thus it is recommended to deploy the SIP Firewall along with the PBX/Gateway deployment as given in the following scenarios based on what is applicable in the user's setup.

Deployment Scenario 1

Figure 3: Scenario 1

Some of the PBX/Gateway devices may have an exclusive LAN/Mgmt Interface for device management purpose other than the Data Interface (also referred as WAN/Public Interface). In such cases LAN Port of the SIP Firewall *should be connected to the Data Interface (WAN/Public Interface).*

Deployment Scenario 2

In the case of IPPBX deployed in the LAN Setup, the following setup is recommended as it would help to protect against the threats from both Internal Network as well as the threats from the Public Cloud penetrated the Non SIP aware Corporate Firewall.

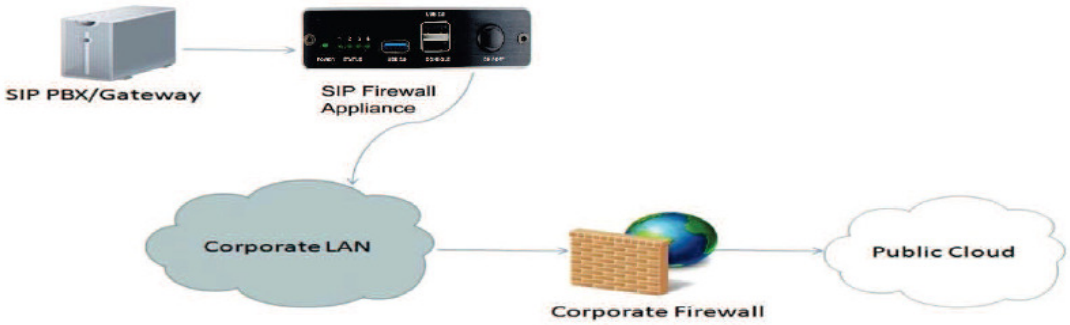

Figure 4: Scenario 2

Deployment Scenario 3

In the case of multiple IPPBX/ VOIP Gateways are deployed in the LAN Setup, the following setup is recommended as it would help to protect against the threats from both Internal Network as well as the threats from the Public Cloud penetrated the Non SIP aware Corporate Firewall.

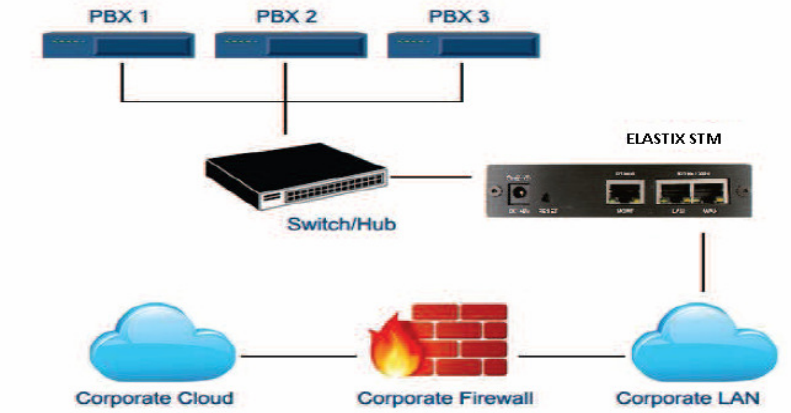

Figure 5: Scenario3

Setup

2. Initial Setup & Configuration

1. Unpack the items from the box
2. Check that you have all the items listed in the package content.
3. Connect the WAN port of the SIP Firewall to the untrusted/public network.
4. Connect the LAN port of the SIP Firewall to the PBX/VOIP Gateway.
5. Connect the appliance to the power socket using the USB power cable.
6. The device will take about a minute to boot up & will be fully functional with the default configuration.

Some of the PBX/Gateway devices may have an exclusive LAN/Mgmt Interface for device management purpose other than the Data Interface (also referred as WAN/ public Interface). In such cases LAN port of the SIP Firewall should be connected to the Data Interface (WAN/ Public Interface).

2.1. Default Configuration

The device operates as a transparent bridging firewall with Deep Packet Inspection enabled on the SIP traffic. By default, the appliance has been configured with static IP of 10.0.0.1 (Net mask 255.255.255.0)

The device has been made to be fully functional with the default configuration. However, if the user needs to tune the device settings & the DPI policies, user can tune the configuration via the Device WebUI.

The device all provides the command line interface accessible via SSH, which will allow to configure the basic settings and view device status.

Management Access	Login Credentials
WebUI	admin/admin
SSH CLI	admin/stmadmin
Management Vlan IP	192.168.100.1/255.255.255.0
Default Device IP	10.0.0.1/255.255.255.0

2.2. Accessing the WebUI

The user can connect to the device via management Vlan to access WebUI during initial setup. The management Vlan configured on the device, is accessible via the LAN/WAN ports & is made assigned to the default IP address '192.168.100.1'

Use the procedure given below to access the WebUI,

1. Connect the LAN port of the SIP Firewall to a PC.
2. Assign the IP Address 192.168.100.2 to the PC. Set the Net mask as 255.255.255.0.

Now you can access the device from the browser using the URL https://<192.168.100.1>

Configure the SIP Firewall Device IP Address from the "Device Settings" Page as per your local network range. Verify the IP address set to SIP Firewall from the dashboard page. Once the user

assigns the SIP Firewall Device IP Address successfully, he can access the device using that IP address further.

Now he can disconnect the PC and connect the LAN Port to the PBX/PBX Network that needs to be protected.

The WebUI has been made accessible only via HTTPS. The recommended browser for accessing SIP Firewall *WebUI is Mozilla Firefox.*

The UI allows the administrator to configure the management Vlan IP addresses. In case if the user has changed the management Vlan IP address, he needs to assign the corresponding network address to his PC for the management access subsequently.

On launching the SIP Firewall *WebUI, the web application will prompt to enter the administrator credentials to login.*

Alternatively the user can access the device via the static IP 10.0.0.1 and configure the network settings during first time installation. Connect a PC to the LAN port of the SIP Firewall *and assign the IP address 10.0.0.100/255.255.255.0 to the PC. Now you can access the device from the browser using the URL https://<10.0.0.1>*

If the device is not accessible after configuring the new network configuration, Try rebooting the device and check the device dashboard accessing via Management Vlan.

Figure 6: Login Page

Configuration Notes:

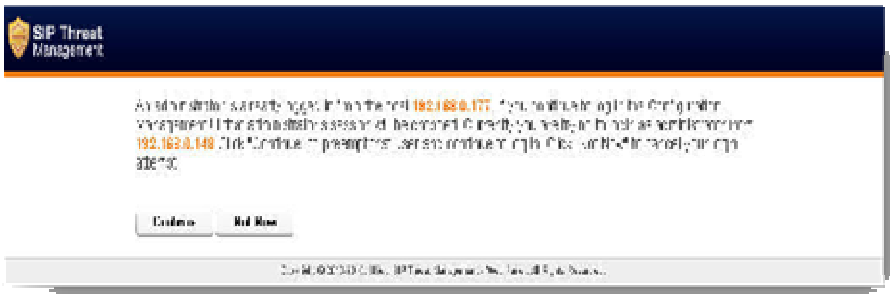

Figure 7: Configuration Notes

Click Continue to proceed.

The WebUI login session has been made to time out and if the user does not enter the login credentials for 30 seconds and will redirect to the informational page. The user can click the hyperlink named as 'login' appearing on the information page, to visit the login page again.

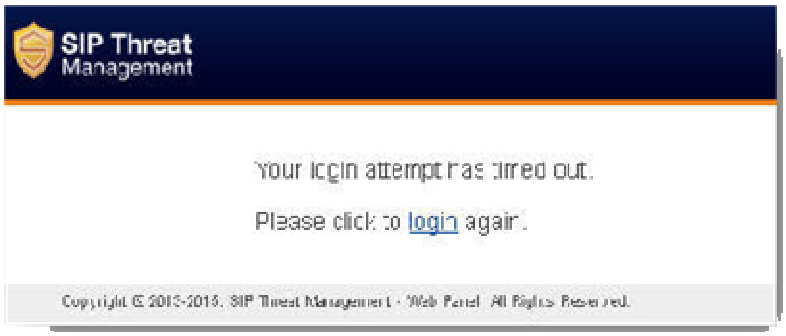

Figure 8: Timeout Message

If somebody is already logged in to SIP Firewall WebUI session, the subsequent attempts to login will notify the details previous login session as illustrated below and will prompt the user to override the previous session and continue OR to discard the attempt the login.

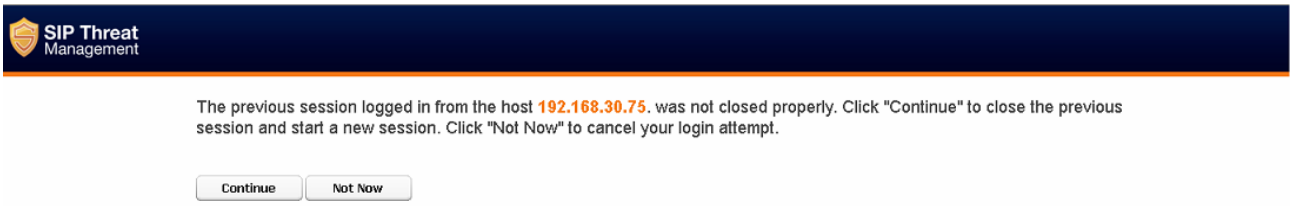

Figure 9: Select Login Attempt

2.3. WebUI Session timeout

After logging into the WebUI, if there is no activity until the WebUI session timeout period (By default, the WebUI session timeout is set to 900 seconds), then the login session will automatically terminated and browser will be redirected to login page again.

2.4. WebUI Settings

To change the WebUI settings, click the settings icon that appears top right corner (below the Apply Changes button). The WebUI settings dialog will be displayed in the browser and allow the administrator to configure WebUI session timeout & WebUI login password. To configure the WebUI login password, the user needs to enter the previously set administrator password.

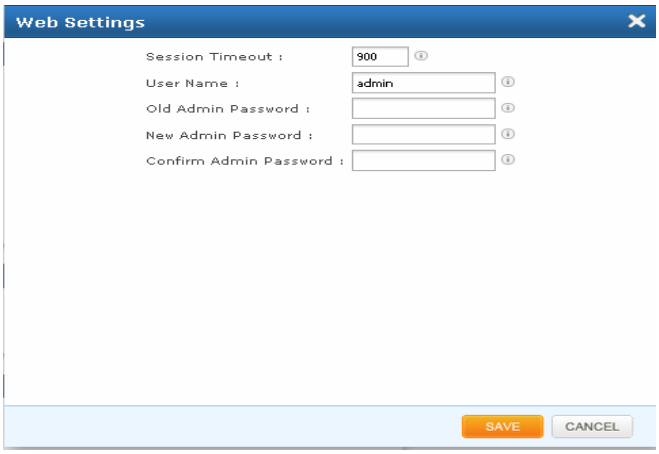

Figure 10: Web Settings

2.5. Dashboard

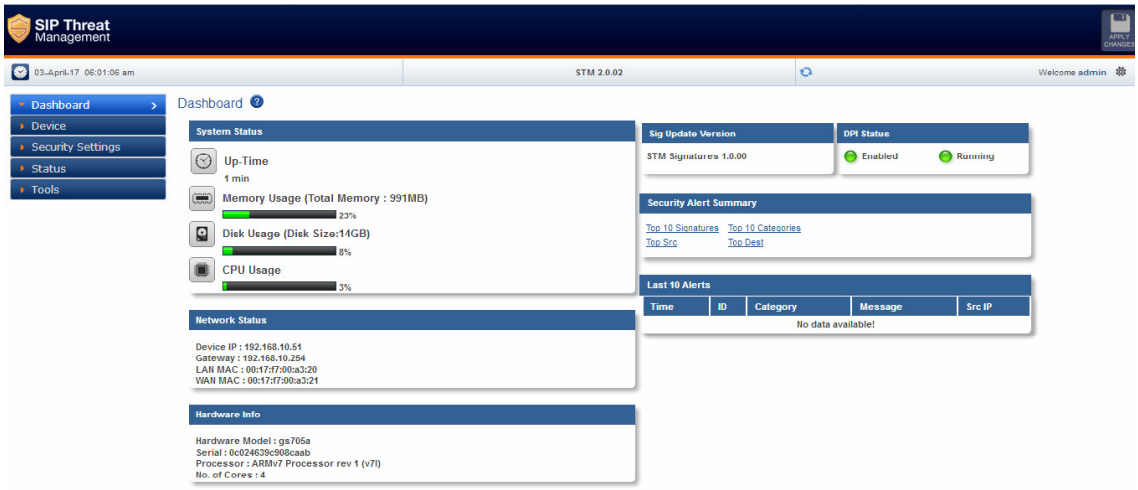

Figure 11: Dashboard

On logging into the SIP Firewall WebUI, the dashboard will be shown.

The user can visit the dashboard page from the any configuration page in the SIP Firewall WebUI, by clicking the SIP Firewall Product Icon that appears in the left corner of the Top panel.

The status panel that appears below the top panel shows the time settings on the device and SIP Firewall firmware version, Page refresh icon and Setting icon.

On clicking the page refresh button, the main content area in the current page will be refreshed.

On clicking the settings icon, the pop menu which contains menu options logout, WebUI settings will be shown.

System Status Panel shows Device up time, Memory Usage, Flash Usage & CPU Usage.

Sig Update Version Panel shows the SIP Firewall Signature version and Release State.

Network Status Panel shows IP, LAN MAC, WAN MAC and Gateway of the device.

Security Alert Summary Panel shows hyperlinks for viewing of Top 10 Signatures hit, Top 10 Categories hit, Top Attacker IP Addresses & Top 10 target destinations.

Device Settings

3. Device

Configuration pages of the SIP Firewall WebUI have been made as self- intuitive and easy to configure.

All the configuration pages have been made to work with the two-phase commit model.

The two-phase commit model is not applicable to time settings and signature update settings. In these settings, the changes will be applied directly by clicking the 'Apply' in the content area of the configuration editor.

I.e. When the administrator changes the settings in the configuration pages and click the Save button, the settings will be saved in a temporary buffer location on the device. On saving the configuration changes, the 'Apply Changes' button that appears in the right top corner will be enabled & the 'Ignore Changes' button will appear next.

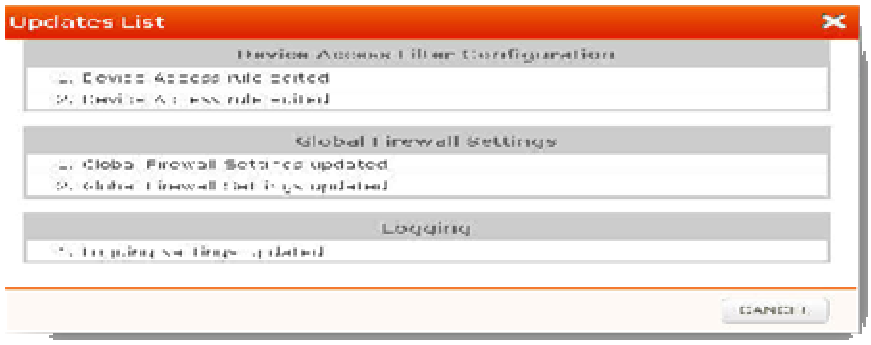

Figure 12: Device Configuration

The number of configuration changes will appear on the immediate left to the 'Apply Changes' button. To view the details of the configuration changes, the user can click the number icon, which will open the configuration changes listing.

The user can apply the configuration changes to the device, by clicking 'Apply Changes' button. On clicking the 'Apply Changes' button, the configuration changes will be applied to the system and updated configuration will be persisted permanently onto the device.

In case if the user wants to abandon the configuration changes made, he can click the Ignore Changes button. On clicking the 'Ignore Changes' button, the configuration changes stored in the temporary buffer location will be discarded.

To apply the configuration changes, the 'Ignore Changes' button will be displayed and they cannot choose to ignore configuration changes. The 'Ignore Changes' button will be disabled, only when there are pending configuration changes that need to be applied yet to the device.

If the administrator tries to configure a configuration element to the inappropriate value, the tooltip icon that appears next to each configuration element will provide the details on the error.

On clicking the help icon that appears next to the configuration title, the help section corresponds the current configuration page will be launched.

3.1. General Settings

Navigate through **Device**> **General Settings**

The General settings page will allow configuring the host/network settings of the SIP Firewall appliance. The device that has been made to work in bridging mode can either choose to work with static IP assignment or to acquire the device IP via DHCP.

The page also allows to enable/disable the SSH Access to the device. The 'Allow ICMP' option will configure the device to respond to the ICMP ping messages sent to SIP Firewall appliances or not.

By the SSH Access and ICMP Ping messages are allowed to the SIP Firewall appliance.

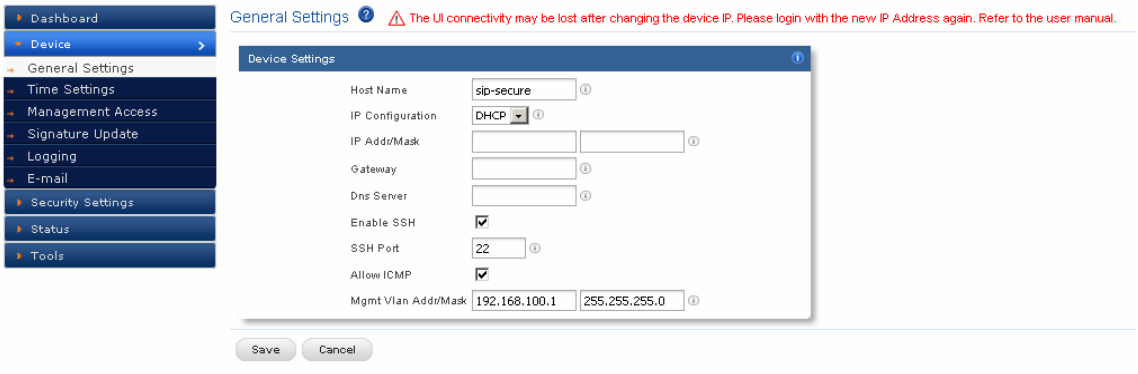

Figure 13: General Settings

Host Name	It allows user to specify the Host name for general settings.
IP Configuration	User can configure IP to be static or DHCP.
IP Addr/Mask	It specifies the IP address and Netmask of SIP Firewall General Settings.
Gateway	It specifies the Gateway IP of the SIP Firewall device. E.g. 10.0.0.254 or 10.0.0.1
Dns Server	It helps for domain name resolutions and it stores the DNS records for a domain name.E.g.:10.0.0.5
Enable SSH	It allows the user to either enable or disable SSH port.
SSH Port	User can specify a particular range of SSH port numbers.
Allow ICMP	It allows the user to either enable or disable ICMP.
Management Vlan Addr/Mask	It specifies the management Vlan IP address and Netmask of SIP Firewall device.

The UI connectivity may be lost after changing the device IP. Please login with the new IP address again.

3.2. Time Settings

Navigate through **Device**> **Time Settings**

The administrator can choose to set the manual time settings on the device or configure the device to sync the time settings from an NTP server. Appropriate time settings/time zone should be set on the device to the correct timestamp to appear on the SIP security alerts generated by the device.

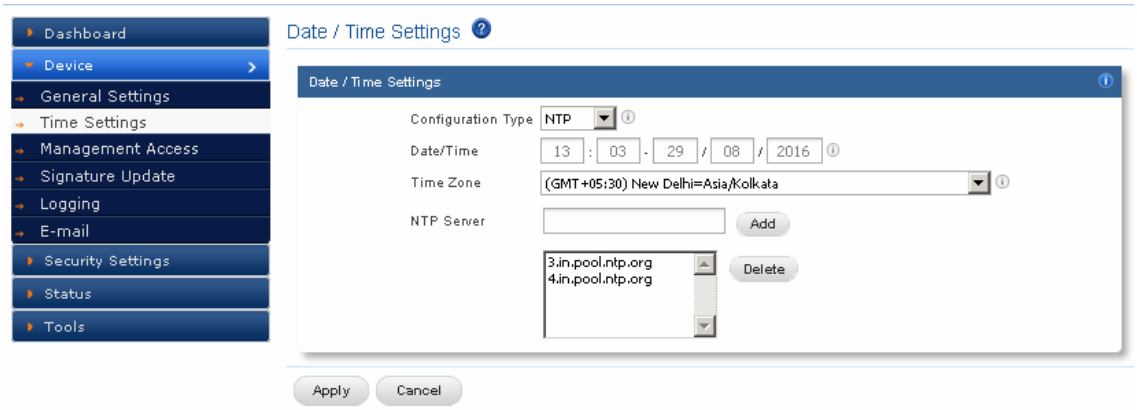

Figure 14: Date/Time Settings

Configuration Type	User can configure either Manual or NTP from the drop down list.
Date/Time	User can configure Date/Time in the format hh:mm-D/MM/YYYY.
Time Zone	User can select time zones from the drop down list.
NTP Server	Enter the NTP server name to synchronize the time of a computer or server. E.g.: 3.in.pool.ntp.org

3.3. Management Access

Navigate through **Device**> **Management Access**

The access the SIP Firewall Device management (SSH CLI / WebUI Access) can be restricted with the management access filters. By default, the access has been allowed to any global address and management Vlan network configurations on the device. The administrator can override these settings.

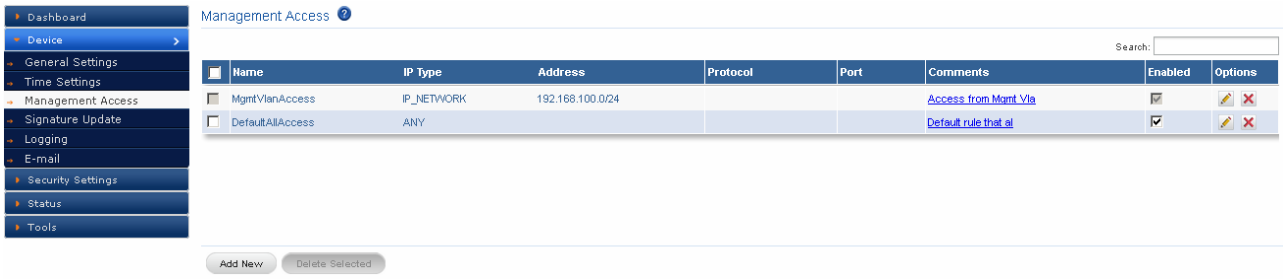

Figure 15: Management Access

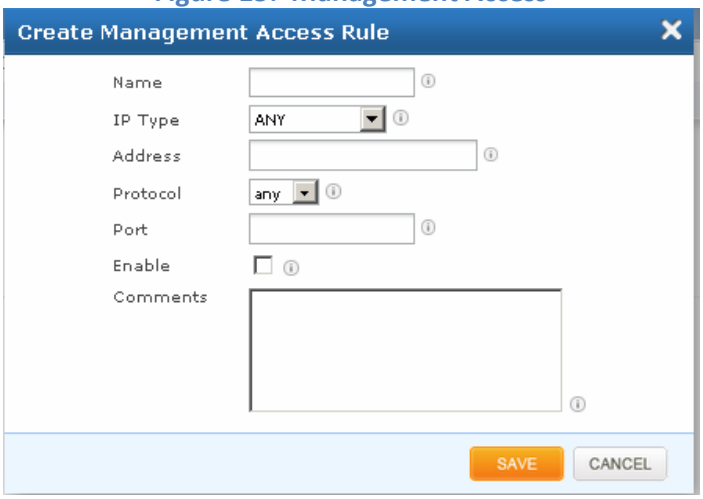

Figure 16: Create Management Access Rule

Name	Enter the name of the Management access for user reference.
IP Type	User can select the appropriate IP type from the drop down list.
Address	Specify IP Address/Netmask or IP range or MAC address.
Enable	It allows the user to either enable or disable Management access rule.
Comments	User can specify the comments in the length of 64 char's. (optional)

The administrator needs to configure the IP Address or the IP Network or the Range of IP Addresses from with management access to the device should be allowed in the management access filter rule. The IP Type 'ANY' indicates global networks (Any network/IP address).

The search option in the management access filters table will help in selectively viewing the management access filter rules whose name/address values that match with the search criteria.

3.4. Signature Update

Navigate through **Device**> **Signature Update**

To enable the automatic signature update, select the checkbox 'enable update' on the device and configure the signature update schedule. The valid subscription key and correct signature update URL should be configured for the signature update to happen.

To update the signatures on the device instantaneously, Click 'Update Signatures now' button.

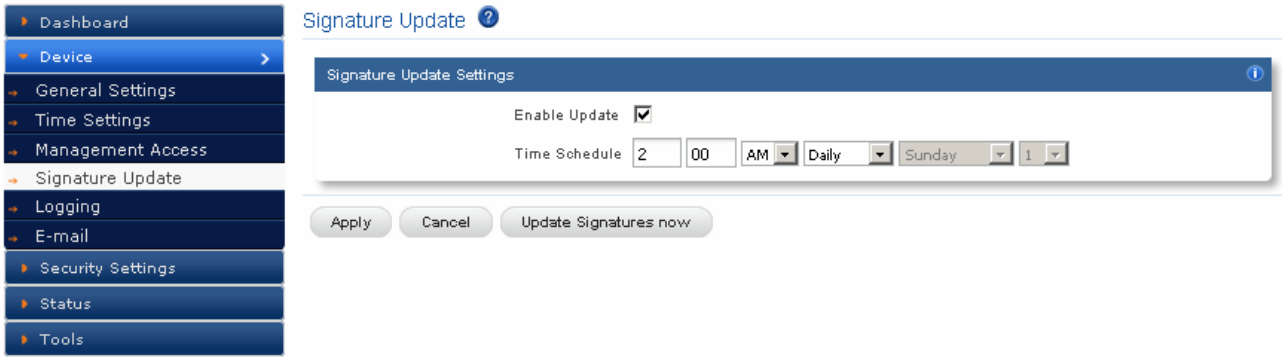

Figure 17: Signature Update

Enable Update	It allows the user to either enable or disable Signature Update.
Time Schedule	It schedule signature update at Configured time in UI.

When the user buys the SIP Firewall *appliance, the device will be shipped with the SIP signatures that will help in protecting against the SIP based attacks known as of date.*

However, if the user wants to ensure their SIP deployments get the protection against the newest attack vectors, it is recommended to enable the signature update on the device. Please check with Allo Sales team about getting the details of purchasing the SIP Firewall signature subscription key.

3.5. Logging

Navigate through **Device**> **Logging**

The administrator can configure the SIP Firewall appliance to send the security alerts generated on detecting the SIP based attacks, to the remote SYSLOG server.

The logging page will allow enable/disable the remote logging of security alerts and to which SYSLOG server the security alerts are to be forwarded.

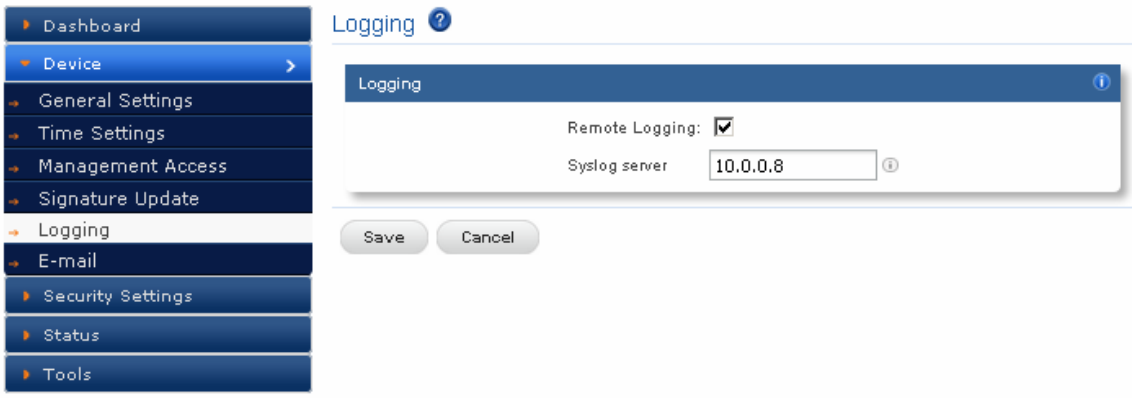

Figure18: Logging

Remote Logging	It allows user to configure Remote Log Server settings.
Syslog Server	User can configure the remote Syslog server where it gets log from the SIP Firewall device.

3.6. Email

Navigate through **Device**> **Email**

Email Server Settings

This feature allows user to send the generated alerts in SIP Firewall to the specified user.

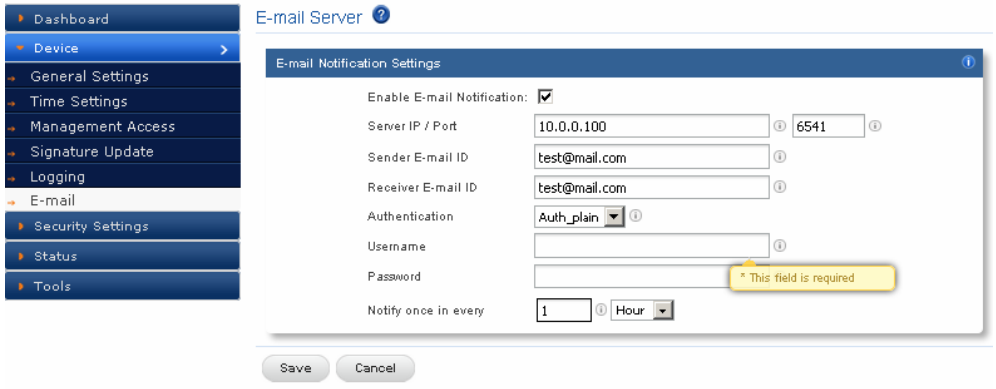

Figure 19: Edit Email Server Settings

Enable E-mail Notification	User can either enable or disable this email notification.
Server IP/Port	User can specify the Email server IP address and Server port.
Sender Email ID	The user can extends the verification process to include professed responsible addresses. E.g.: test@shield.com
Receiver Email ID	The user can specify the Receiver email id E.g.: testing@shield.com
Authentication	User can select authentication from the drop down list. If authentication is required by the End point.
Username	Username of endpoint (e.g.: Testing) will use to authenticate with the Email server settings.
Password	Enter the Password and its authenticating Email server settings.
Notify once in every	User can notify the alerts in email for every week, every day etc.

Security Settings

4. Security Settings

4.1. SIP Attacks Detection

Navigate through **Security Settings** > **SIP Attacks Detection**

The SIP Attack Detection page allows to configure the SIP Deep packet Inspection rules categories. The administrator can enable/disable the inspection against a particular category of rules, action to be taken on detecting attacks matching the rules in the categories.

The possible actions that the SIP Firewall can execute are logging the alert, block the packets containing the attack vector and blacklist the attacker IP for the given duration. The blocking duration of how long the attacker up needs to be blocked is also configured per category level.

Figure 20: SIP Attacks Detection

The table given below lists the SIP Deep Packet Inspection rules categories supported in SIP Firewall and configuration parameters in each category.

Category	Description	User Configurable options
Reconnaissance Attacks	This can be considered as the first step of attacking any system or a network. In this a hacker tries to learn information about our network typically conducts a ping sweep of the target network to determine which IP addresses are alive. Then the intruder determines which services or ports are active on the live IP addresses. From this information, the intruder queries the ports to determine the type and version of the application and operating system running on the target host.	-

	The attacker often uses port scanning, for example, to discover any vulnerable ports. After a port scan, an attacker usually exploits known vulnerabilities of services associated with open ports that were detected.	
SIP Devices Scanning	The intruder will scan the PBX ports to see what devices are connected to it. With that info, he can exploit 3rd party vulnerabilities. The SBC will not respond to his query.	-
SIP Extensions Discovery	The intruder will ask the PBX to divulge the range of the extension numbers. With that info, he can try different passwords to take control of these extensions. The SBC will not respond to that query.	Invalid SIP User Registration Attempts/Duration
Multiple Authentication Failures/Brute force password Attempt	The intruder will try to log in with different user names and passwords multiple times. Once he succeeds, he will have control of that extension. The SBC can block, log or blacklist the IP for a period of time if it exceeds the authorized number of trials/second.	Failed Authentication Attempts/Duration
Ghost calls Attempt	The intruder will generate calls to an extension and it will look like the calls come from that same extension. His goal is to crash the PBX resulting in disrupted communication. The SBC can block, log or blacklist the IP for a period of time if it exceeds the authorized number of trials/second.	No of Anonymous Invite Responses/Duration
SIP Protocol Compliance	This kind of attacks refers to use of some kind of automated tool like SIPP to generate false script where some of the most important fields of SIP headers and body can body can be modified in	-

	terms of their length like "**From header length", "To Header length", "Contact length".** It can also be useful in handling the correct use of Maximum Dialog within a session, SIP Ports and its Protocol.	
SIP Anomaly Attacks	The SIP Deep packet inspection engine running the SIP Firewall appliance has been made to inspect the SIP traffic with the SIP Security Compliance rules in built into the SIP DPI engine. The anomalies in the SIP Message headers can result to various erroneous conditions, SIP parser failures & malformed packets which will lead to SIP applications vulnerable to attacks. The Default parameters will be used by the SIP deep packet engine for identifying the different protocol anomaly conditions and take the action configured by the administrator. Configuring inappropriate values for these parameters can result to the disruptive impact in the VOIP deployment. Administrators with more in-depth understanding with the SIP Protocol can choose to tune these parameters for their specific deployment needs. Otherwise, it is recommended to use the default settings for these parameters.	-
SIP Dos Attacks	Flooding attempts using various SIP messages.	No of SIP Request Messages/Duration
SIP DDos Attacks	Distributed flooding attempts using various SIP messages.	No of SIP Response Messages/Duration
SIP Cross site	Cross Site Scripting (also known as XSS or CSS) is	-

scripting Attacks	one of the most common application layer hacking techniques. In general, cross-site scripting refers to that hacking technique that leverages vulnerabilities in the code of a web application allow an attacker to send malicious content from an end-user and collect some type of data from the victim. The use of XSS might compromise private information, manipulate or steal cookies, create requests that can be mistaken for those of a valid user, or execute malicious code on the end-user systems. It can be used to steal data about **"From Header", "To Header", "Call -ID", "CONTACT ","Extension Password** and other such confidential data.	
Buffer overflow Attacks	This refers to illegally trying to access the resources of the SIP device like its memory address for which it does not have the authenticate permissions leading to data corruption of this address along with its adjacent address.	-
3rd Party Vendor Vulnerabilities	This attack refers to any malicious activities from 3rd party like DIGIUM Asterisk channel driver DOS attempt and other such attack.	-
TCP Syn Flood	It's a kind of DOS attack in which a large number of **TCP SYN** packets are sent to the victim's device .Each of these packets will try to establish a new session, thus consuming the victim's device resources. Such attack is also called open half connection as these new sessions are not	No of TCP Syn Packet within specified duration

	terminated and finally the legitimate users are barred from availing the Device resources.	
TCP Flood	This refers to flooding the device with general TCP packet on any port where legitimate users are barred from availing the Device resources after some interval of time.	No of TCP Packet within specified duration
TCP Distributed Flood	In a **TCP DDos** attack, the incoming **TCP traffic** flooding the victim originates from many different sources – potentially hundreds of thousands or more. This effectively makes it impossible to stop the attack simply by blocking a single IP address; plus, it is very difficult to distinguish legitimate user traffic from attack traffic when spread across so many points of origin.	No of TCP Packet within specified duration
UDP Flood	This refers to flooding the device with general **UDP** packet on any port where legitimate users are barred from availing the Device resources after some interval of time.	No of UDP Packet within specified duration
UDP Distributed Flood	In a **UDP DDos** attack, the incoming **UDP traffic flooding** the victim originates from many different sources – potentially hundreds of thousands or more. This effectively makes it impossible to stop the attack simply by blocking a single IP address; plus, it is very difficult to distinguish legitimate user traffic from attack traffic when spread across so many points of origin.	No of UDP Packet within specified duration
Generic Attacks	Some of the common attacks under this category are Bye Teardown, Registration Hijack, Registration Adder, and Registration Eraser. 1) Bye Teardown attack disrupts a call that is in	-

	session between two users. 2) **Registration Hijack:** The first step in hijacking a registration is to find register able addresses and it hijacks the already registered extension. 3) **Registration Adder:** This tool attempts to bind another SIP address to the target, effectively making a phone call ring in two places (the legitimate user's desk phone and the attacker's phone). 4) **Registration Eraser:** This tool will effectively cause a denial of service by sending a spoofed SIP REGISTER message to convince the proxy that a phone/user is unavailable.	

4.2. SIP Servers

Navigate through **Security Settings** > **SIP Servers**

User can configure all these parameters to avoid IP spoofing attack. In IP spoofing attacker will sniff your IP address and make your system Vulnerable.

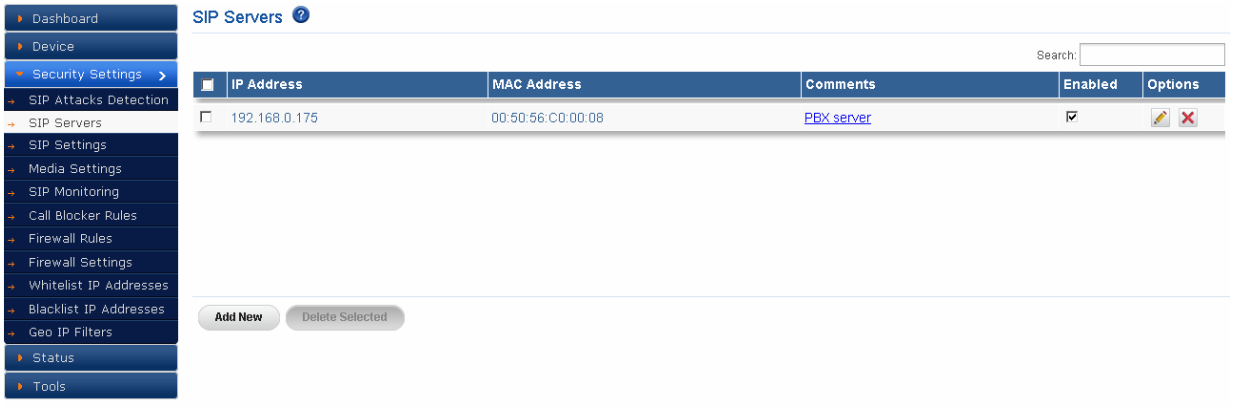

Figure 21: SIP Servers

Click **Add New** button, to create SIP Server rule

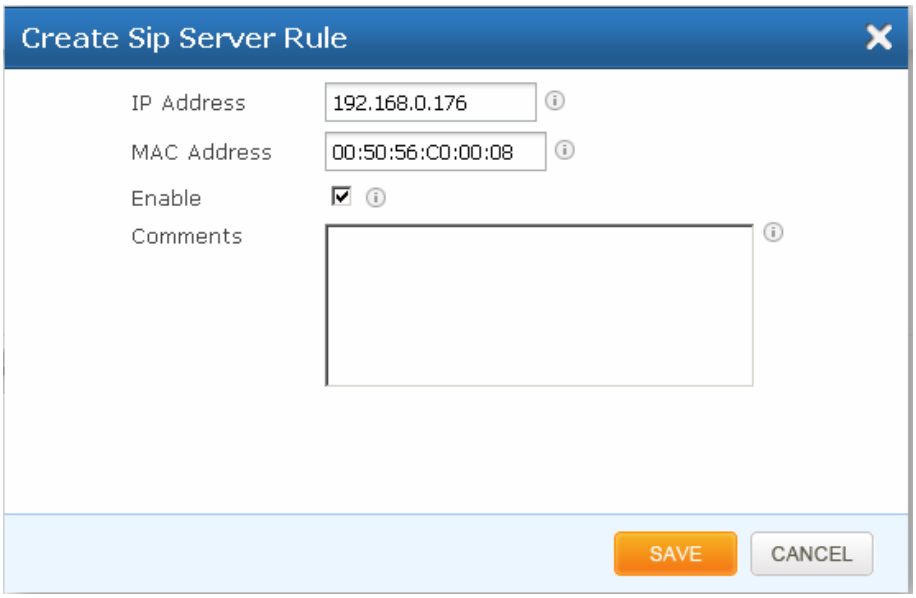

Figure 22: Create SIP Server Rule

Create SIP Server Rule

IP Address	Specify IP Address for SIP servers on a Network.
MAC Address	User can specify MAC Address for SIP servers on a Network. E.g.: 00:17:F7:00:9A:A2
Enable	It allows the user to either enable or disable SIP Server Rule.
Comments	User can specify the comments in the length of 64 char's. (optional)

4.3. SIP Settings

Navigate through **Security Settings** > **SIP Settings**

It allows user to configure SIP compliance settings and SIP media Port Configuration.

The SIP Deep packet inspection engine running the SIP Firewall appliance has been made to inspect the SIP traffic with the SIP Security Compliance rules in built into the SIP DPI engine.

The anomalies in the SIP Message headers can result to various erroneous conditions, SIP parser failures & malformed packets which will lead to SIP applications vulnerable to attacks.

The following parameters will be used by the SIP deep packet engine for identifying the different protocol anomaly conditions and take the action configured by the administrator.

Configuring inappropriate values for these parameters can result to the disruptive impact in the VOIP deployment. Administrators with more in-depth understanding with the SIP protocol can choose to tune these parameters for their specific deployment needs. Otherwise, recommended to use the default settings for these parameters.

Please make sure to refer the user manual before making changes in the configuration page.

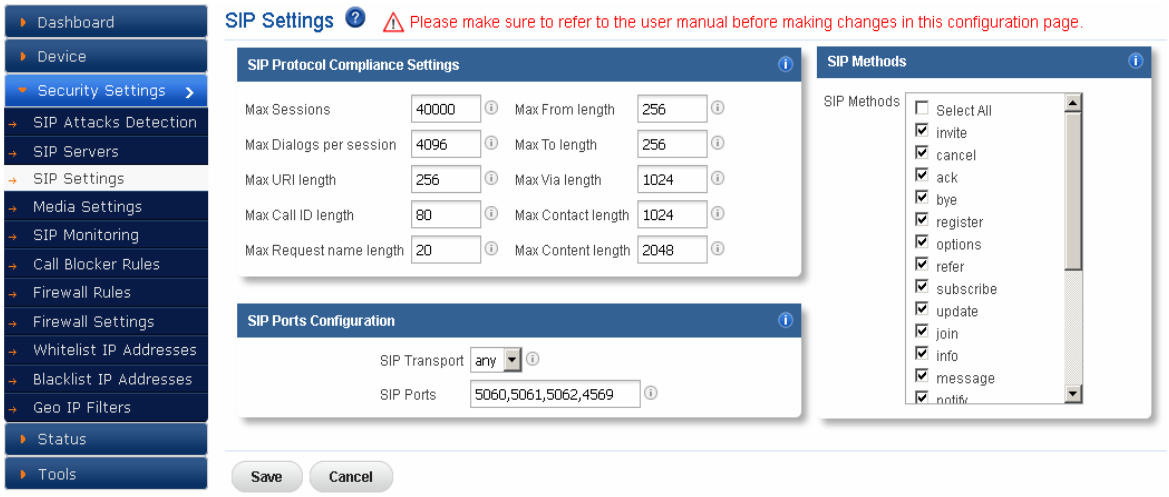

Figure 23: SIP Settings

SIP Protocol Compliance Settings

Max_sessions

A SIP session is the application level connection setup created between the SIP server and SIP client for exchanging the audio/video messages with each other.

The max_sessions parameter defines the maximum number session that SIP deep packet inspection engine can keep track of. The default value has been set at 4096.

Max Dialogs per Session

Max_Dialogs_per_session specifies the maximum number of SIP message transaction that can happen between the SIP server and client.

Methods

This specifies on what methods to check for SIP messages. Following are the SIP messages that SIP DPI Engine can identify: (1) invite, (2) cancel, (3) ack, (4) bye, (5) register, (6) options, (7) refer, (8) subscribe, (9) update (10) join (11) info (12) message (13) notify (14) prack.

Max_url_len

The Url identifies the user or service to which SIP request is being addressed. Max_url_len specifies the maximum Request URL field size. The Default is set to 256. The allowed range for this option is 1 - 65535.

Max_call_id_len

The Call-ID header field in SIP message acts as a unique identifier that relates to sequence of messages exchanged between SIP client and server. Max_call_id_len specifies the maximum Call-ID field size. The Default is set to 256. The allowed range for this option is 1 - 65535.

Max_requestName_len

Max_requestName_len specifies the maximum request name size that is part of the CSeq ID. The Default is set to 20. The allowed range for this option is 1 – 65535

Max_from_len

The From header field indicates the identity of the initiator of the SIP request. Max_from_len specifies the maximum from field size. The allowed range for this option is 1 - 65535.

Max_to_len

The header field specifies the desired recipient of the SIP request. Max_to_len specifies the maximum to field size. The Default is set to 256. The allowed range for this option is 1 - 65535.

Max_via_len

The Via header field indicates the transport used for the SIP transaction & identifies the location where the SIP response is to be sent.

Max_via_len specifies the maximum via field size. The Default is set to 1024. The allowed range for this option is 1 - 65535.

Max_contact_len

The Identifier used to contact that specific instance of the SIP client/server for subsequent requests. Max_contact_len specifies the maximum Contact field size. The Default is set to 256. The allowed range for this option is 1 - 65535.

Max_content_len

Max_content_len specifies the maximum content length of the message body. The Default is set to 1024. The allowed range for this option is 1 - 65535.

SIP Ports Configuration

SIP Transport – User can select SIP transport type either TCP or UDP or any which are related to SIP communication from GUI.

SIP Ports – User can configure SIP ports which are related to the SIP communication from GUI. E.g.: 5060, 5061,5070

SIP Methods- User can select options from the SIP method lists.

SIP/Media Ports Configuration

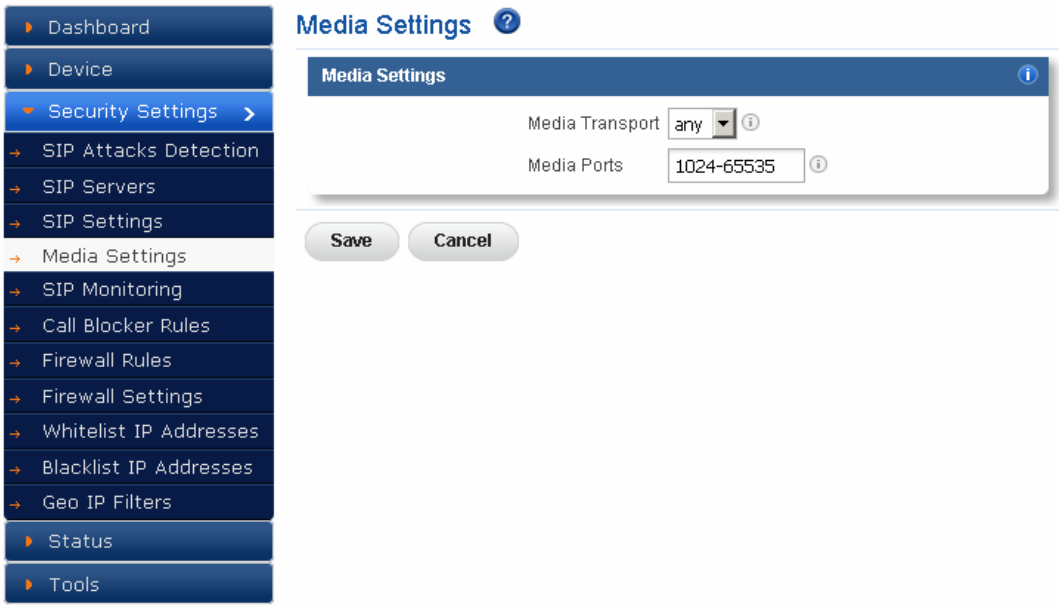

Figure 24: Media Settings

It allows users to configure SIP/Media port configuration.

It is used to store and deliver information or data over communication medium. Media may be TCP based or UDP based communications.

SIP Firewall media settings allows user to choose the communication medium of the SIP traffic. It supports TCP, UDP or Both as communication media for SIP Communications. Media ports allow user to configure media ports like 1024-65535.

SIP/Media Ports Configuration	
SIP Transport	It allows user to select the type of Media Transport. EX.TCP, UDP or any.
SIP Ports	User can specify a value for SIP ports. E.g.: 5060,5061
Media Transport	It allows user to select the type of Media Transport. EX.TCP, UDP or any.
Media Ports	User can configure SIP Media ports which are related to SIP communication media. Ex: 1024-65535

4.4. SIP Monitoring

Navigate through **Security Settings** > **SIP Monitoring**

User can enable the SIP Monitoring, to see the normal SIP traffic flowing across your network.

SIP Monitoring is an online monitoring service that proactively monitors the ability of VoIP infrastructure components to establish and maintain VoIP calls. It proactively monitors VoIP services using Session Initiation Protocol (SIP) the signaling protocol typically used for VoIP.

Figure 25: SIP Monitoring

4.5. Call Blocker Rules

Navigate through **Security Settings** > **Call Blocker Rules**

A user can block the calls statically by making use of "Call Blocker Rules" feature in SIP Firewall. This feature will block the calls by various viable options such as Phone number, Phone number prefix, Phone Extension, Phone Extension Prefix, IP address and User Agent. It allows you to configure multi rules to block different calls.

It displays the Call Blocker Rules along with name, Caller Block type, Value, Comments, Enabled, and Options.

Block Anonymous Calls – User cannot able to make call for unknown numbers.

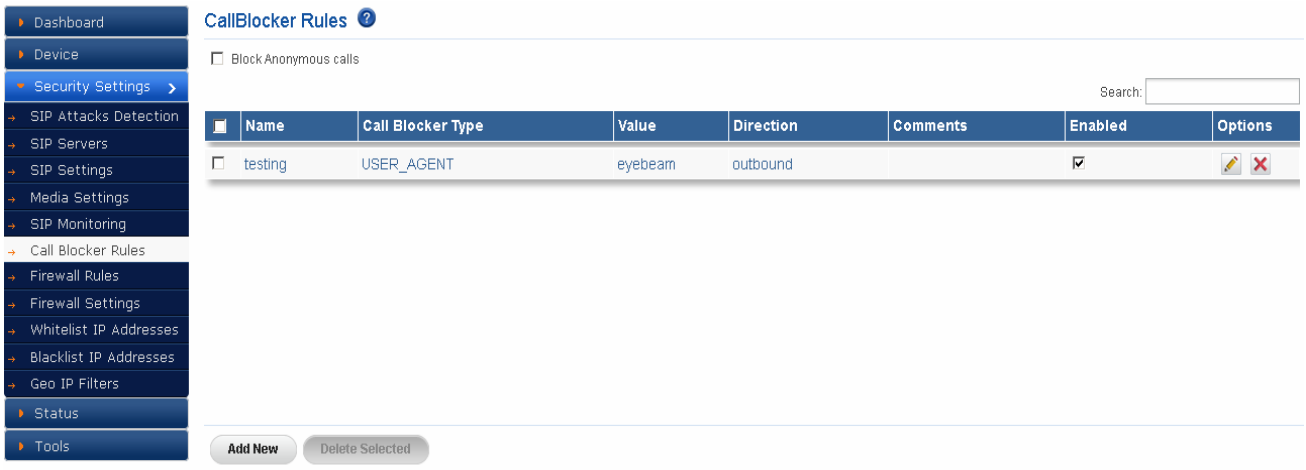

Figure 26: Call Blocker Rules

Click **Add New** button, to create Call Blocker Rule.

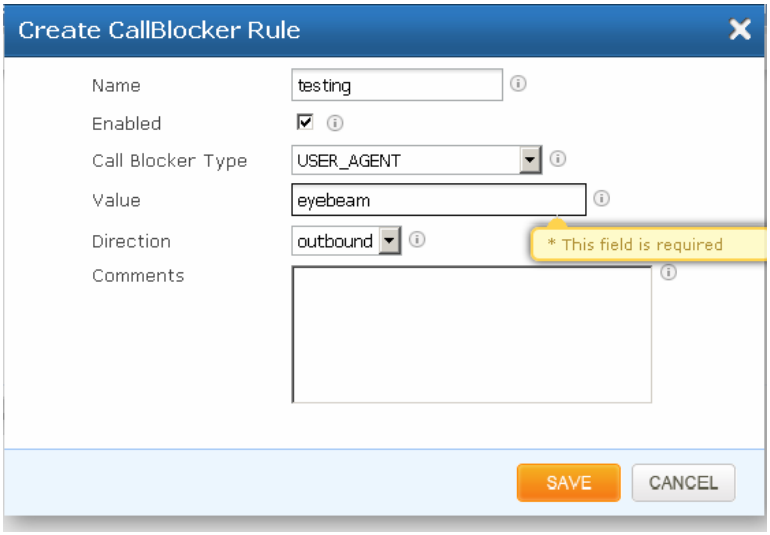

Figure 27: Create Call Blocker Rule

Name	Specify the name for the Call Blocker Rule for user's reference. The user can choose any name to recognize the Call Blocker Rules.
Enabled	It allows the user to either enable or disable Call Blocker Rule.
Call Blocker Type	User can select the appropriate Call Blocker type from the drop down list. It allows user to block the calls that reaching to PBX

	system i.e. protected by the SIP Firewall. E.g. 1. **Phone number:** User can block the SIP communication which is originated from any phone number. E.g. 989002345 2. **Phone number prefix:** User can block the SIP communication which is originated from any phone number by specifying phone extensions. E.g.: 0 or +91 3. **Phone Extension**: User can block the SIP communication by specifying phone extensions. E.g.: 100,101, 3004 4. **Phone Extension Prefix:** User can block the SIP communication by specifying prefix of phone extensions. E.g.: 0 5. **IP Address:** User can block the SIP communication which is coming from configured IP in GUI. E.g192.168.0.58 **User Agent:** Each phones having their unique user agents. They can block the SIP communication by configuring user agent in GUI. E.g.: eyebeam release 1003s stamp 31159
Value	User can specify the value of Call blocker types like IP address, Phone number, user agent etc. E.g.: Phone number- 989002345 IP Address- 192.168.0.58
Direction	User can block calls from inbound or outbound direction i.e. incoming and outgoing. E.g.: outbound no 1000 means no body will be able to make call to 1000. similarly outbound number 1000 means that extension 1000 will not be able make class outside.

Blocking Duration	It specifies the duration for which the attacker/defaulter IP will be blocked.
Comments	User can specify the comments in the length of 64 char's. (optional)

4.6. Firewall Rules

Navigate through **Security Settings** > **Firewall Rules**

The firewall rules configuration will allow the administrator in configuring what traffic should be allowed to protect SIP PBX/Gateway network from an untrusted wan zone, besides DPI enabled SIP traffic and RTP traffic. The administrator needs to specify the source and destination networks and port numbers and protocol that will be used as the matching criteria in the filtering rules and action to be taken on matching the filtering rule. The possible actions are to block the traffic and allow the traffic on matching the filtering rule. The rules precedence will be in the order in which the rules configured on firewall rules table.

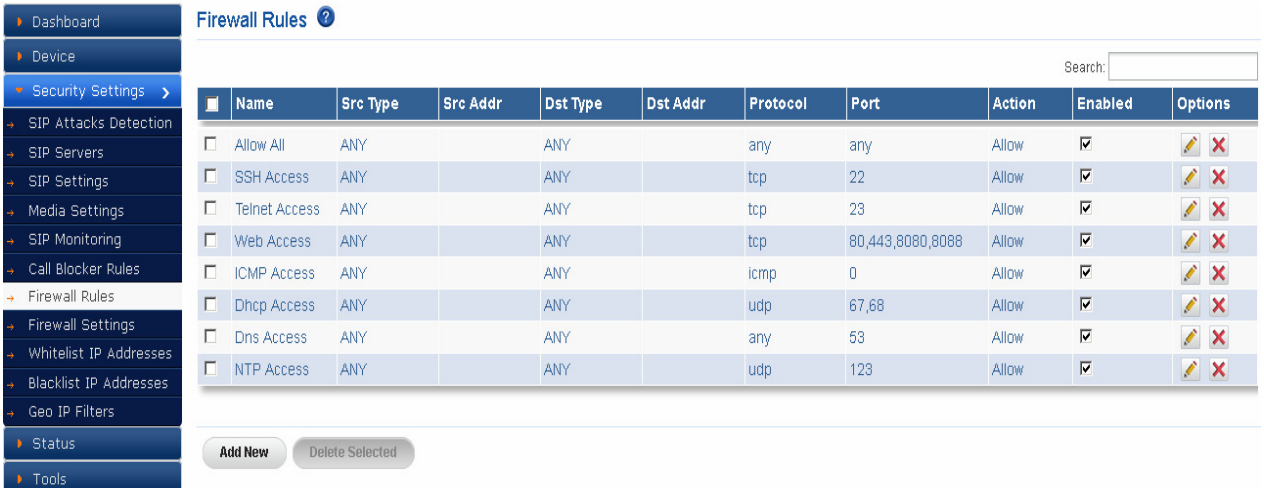

Figure 28: Firewall Rules

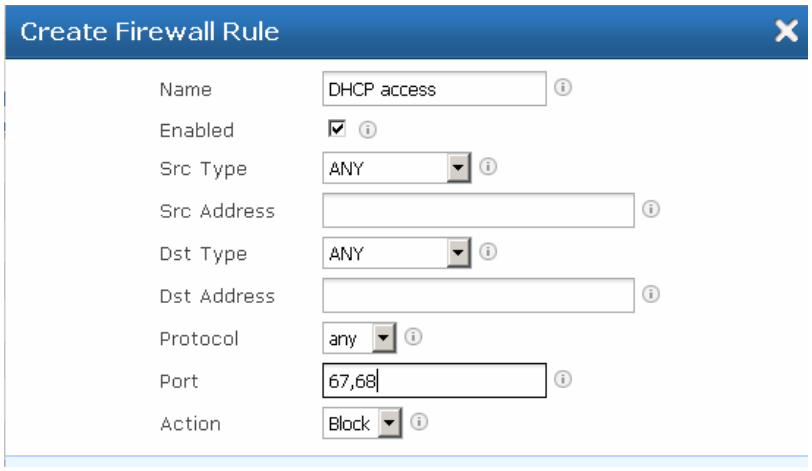

Figure 29: Create Firewall Rule

Name	Specify the name for the Firewall Rules for user's reference. The user can choose any name to recognize the Firewall Rules.
Enabled	It allows the user to either enable or disable Firewall Rules.
Src Type	User can select the appropriate Src type from the drop down list.
Src Address	User can configure and apply the Firewall rule to particular Source Address (Src Address). E.g.10.0.0.3
Dst Type	User can select the appropriate Dst type from the drop down list.
Dst Address	User can configure and apply the Firewall rule to particular destination Address (Dst Address). E.g.:192.168.0.8
Protocol	Protocols specify interactions between the communicating entities. User can select the type of protocol whether it is TCP or UDP from the drop down list.
Port	User can configure and apply the Firewall rule to particular port number.E.g.:5060
Action	User can select the action either block or action from the drop down list.

4.7. Firewall Settings

Navigate through **Security Settings**> **Firewall Settings**

Firewall Settings allows user to configure TCP Flood Rate, TCP Flood Burst, UDP Flood rate and UDP Flood Burst in Global firewall settings.

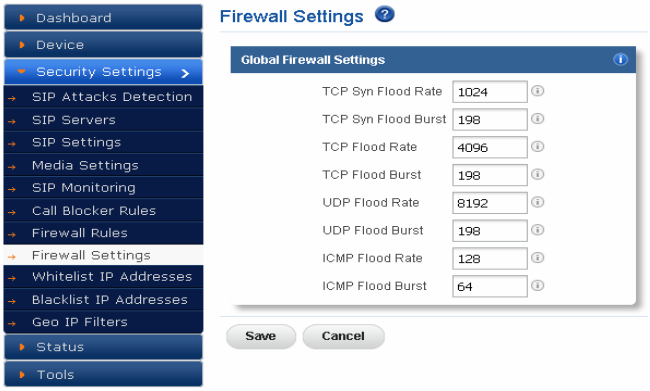

Figure 30: Firewall Settings

4.8. Whitelist IP Addresses

Navigate through **Security Settings** > **Whitelist IP Addresses**

This page allows to configure the white listed IP addresses in the untrusted wan zone from which the access to communicate with the protected SIP network will be allowed by the SIP Firewall.

This page will also allow configuring whether the white rules take precedence over the blacklist rules (both static and dynamic) configured on the device at any instant.

Figure 31: Whitelist IP Addresses

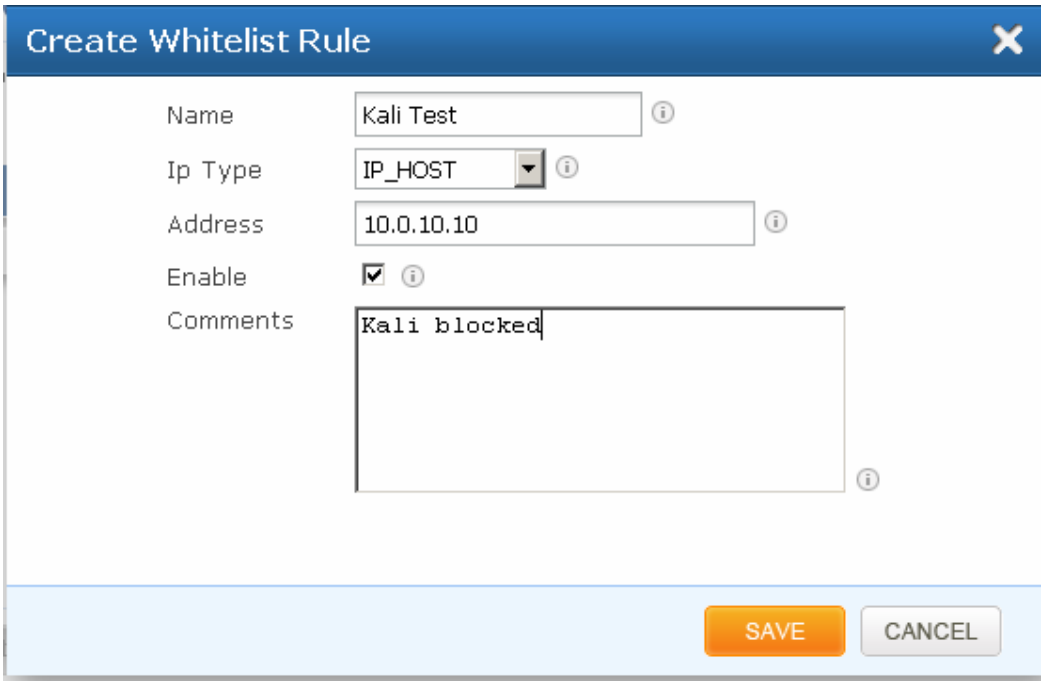

Figure 32: Create Whitelist Rule

Name	Specify the name for the White list Rules for user's reference. The user can choose any name to recognize the White list Rules.
IP Type	User can select the appropriate IP type from the drop down list.
Address	Specify IP Address/Netmask or IP range or MAC address.
Enable	It allows the user to either enable or disable White list Rules.
Comments	User can specify the comments in the length of 64 char's.

4.9. Blacklist IP Addresses

Navigate through **Security Settings** > **Blacklist IP Addresses**

This page allows to configure the blacklisted IP addresses in the untrusted wan zone from which the access to communicate with the protected SIP network will be blocked by the SIP Firewall.

This page will also allow configuring whether the white rules take precedence over the blacklist rules (both static and dynamic) configured on the device at any instant.

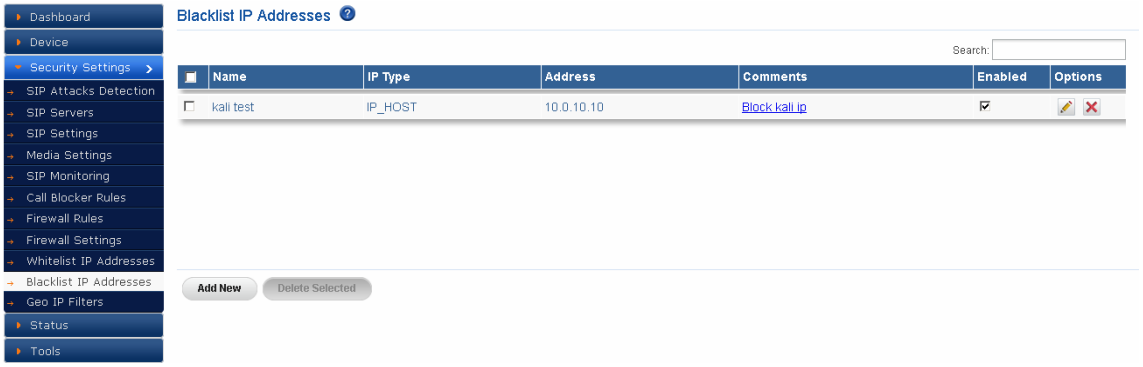

Figure 33: Blacklist IP Addresses

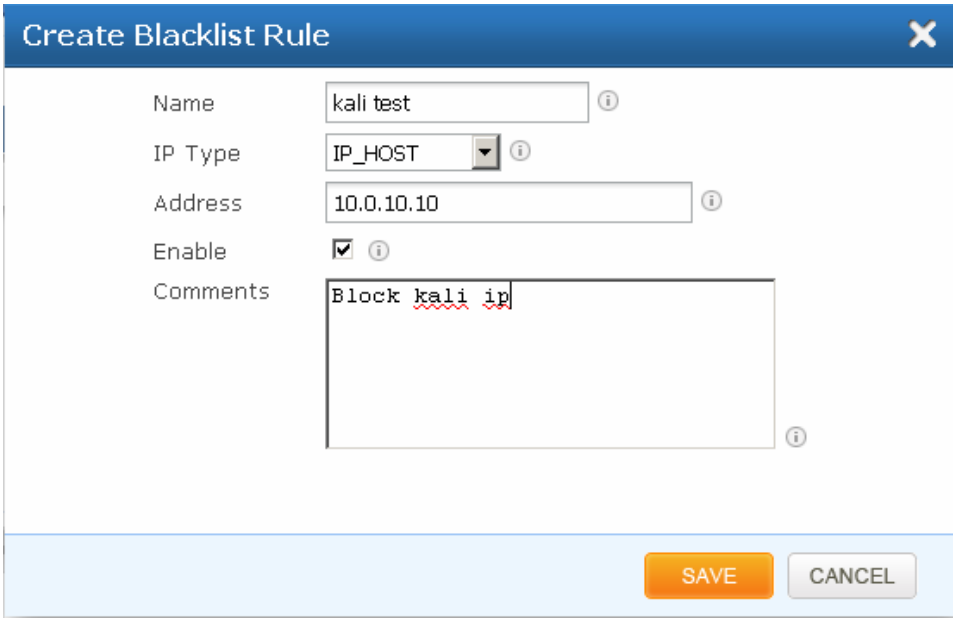

Figure 34: Create Blacklist Rule

4.10. Geo IP Filters

Navigate through **Security Settings** > **Geo IP Filters**

The administrator can choose to block the traffic originating from the specific countries towards the protected SIP network, by configuring the GeoIP filter rules in SIP Firewall.

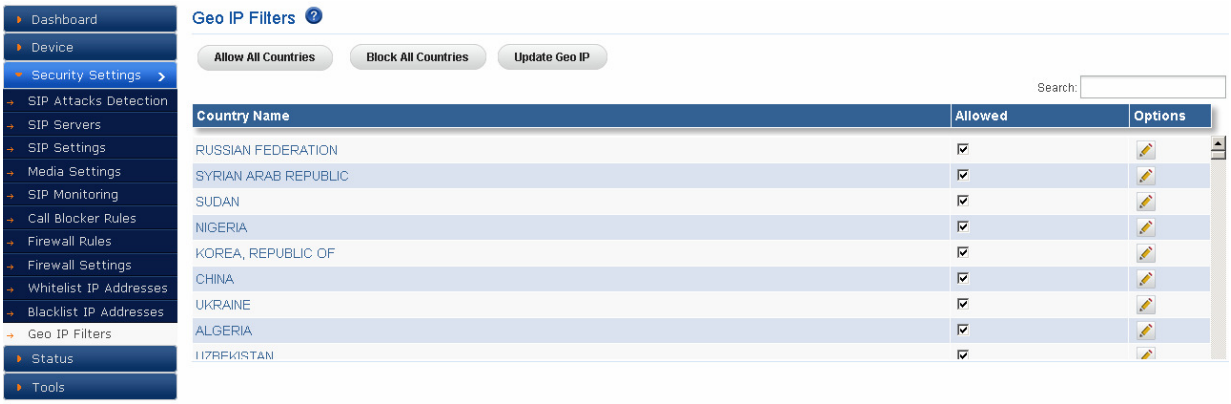

Figure 35: Geo IP Filter

5. Status

5.1. Security Alerts

Navigate through **Logs**> **Security Alerts**

The status alerts page shows the list of alerts pertaining to the SIP attacks detected the SIP Firewall Deep packet inspection engine at any instant.

The administrator can choose to set log viewer page refresh interval in this page. It also chooses to configure the device to send email notifications summary about the security alerts generated by the device.

The option to download the security alerts shown in this page in CSV format is available on the page.

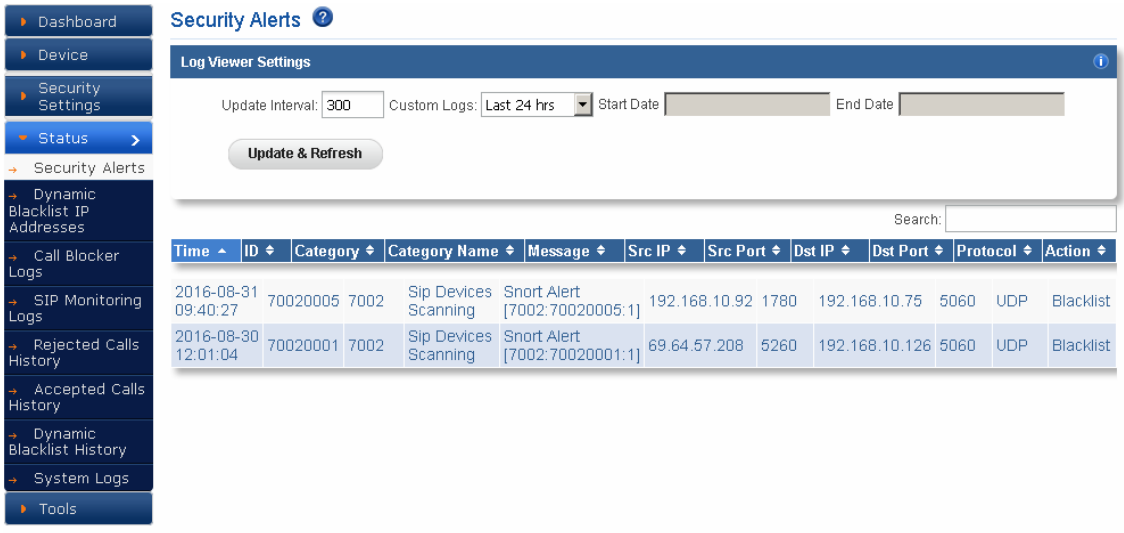

Figure 36: Security Alerts

Unless the user configures to forward the security alerts to remote SYSLOG server, the security alerts are not persisted permanently on the device. The logging buffer location will be flushed at the predefined interval (not configurable) will once the logging threshold criteria met. However, if the administrator wants to persist the alerts into an USB storage, they can connect the USB storage to the USB data port of SIP Firewall *appliance. The rotated logs will be automatically archived in CSV format into USB storage by the* SIP Firewall *appliance.*

5.2. Dynamic Blacklist IP Addresses

Navigate through **Security Settings** > **Dynamic Blacklist IP Addresses**

The dynamic blacklist IP Addresses are the blocking rules added by the SIP Firewall deep packet
inspection engine to block the traffic from attacker IP addresses for the blocking duration configured in the rules category, on detecting the attack.
The dynamic blacklist IP addresses will allow the administrator to see the dynamic blacklist rules
currently configured on the device at any instant. In case, if the administrator wants to override
and allow the traffic from particular blacklisted IP, he can delete the rule from the dynamic blacklist IP addresses page.

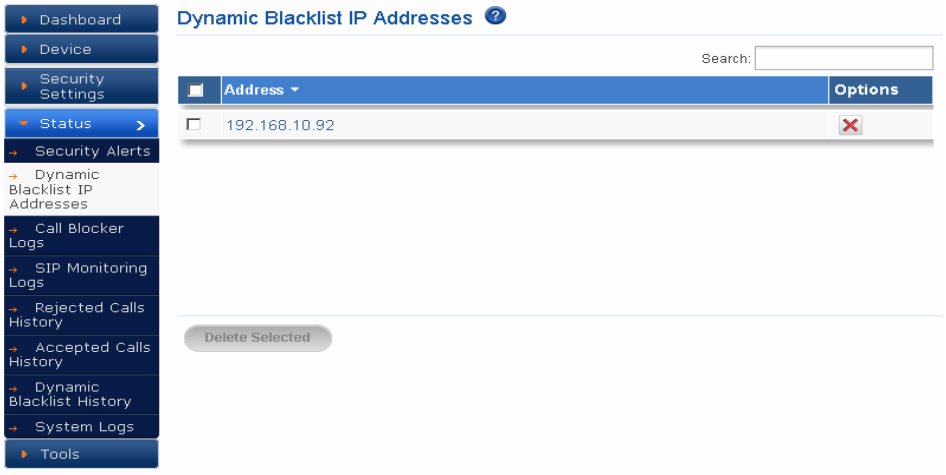

Figure 37: Dynamic Blacklist IP

5.3. Call Blocker Logs

Navigate through **Logs**> **Call Blocker Logs**

You can see the logs for the call blocker rule which you have configured at call blocker module. It shows the, source timestamp IP address, source port which tries to make that call attempt.

Log Viewer Settings

Update Refresh Interval- Users can Update & Refresh the page interval.

Refresh- click refresh button, to update the displayed messages and to reflect the most recent changes to a call blocker logs being viewed.

Download Logs- User can have the option to download the security alerts shown in this page in CSV format is available on the page.

Search- You can check the call blocking messages that you have created and also search by mentioning the call blocking names in the search tab. Particular log can search by making use of Search field.

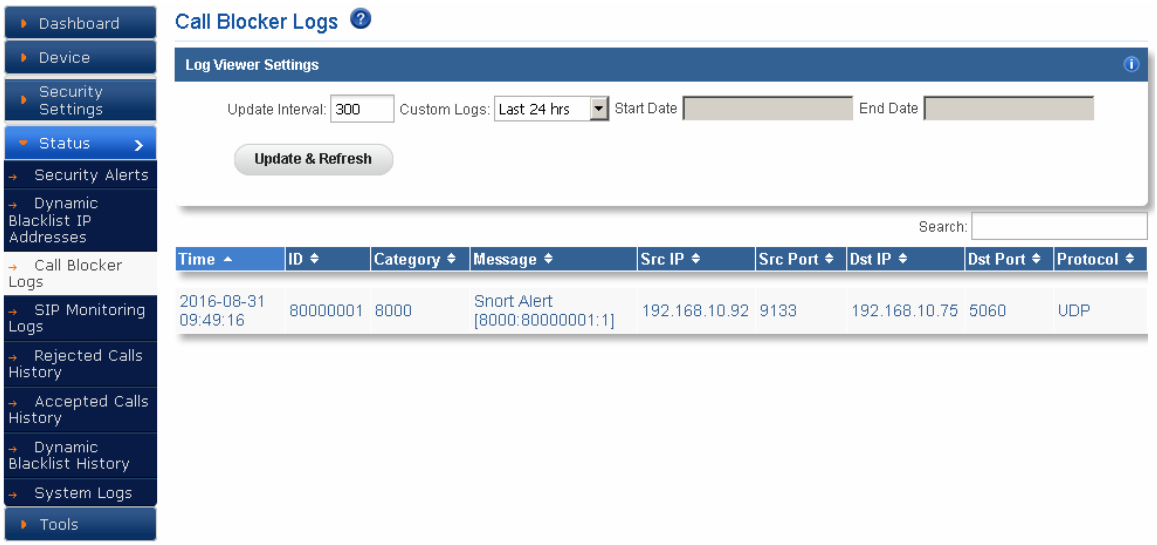

Figure 38: Call Blocker Logs

5.4. SIP Monitoring Logs

In this log you can see the normal sip traffic flowing across your network including parameters like source timestamp IP address, source port which tries to make that call attempt.

Log Viewer Settings

Update Refresh Interval- Users Can Update & Refresh the page interval.

Refresh- click refresh button, to update the displayed messages and to reflect the most recent changes to a SIP monitoring logs being viewed.

Download Logs- User can have the option to download the security alerts shown in this page in CSV format is available on the page.

Search- You can check the Monitoring Log messages that you have created and also search by mentioning the system log names in the search tab. Particular log can search by making use of Search field.

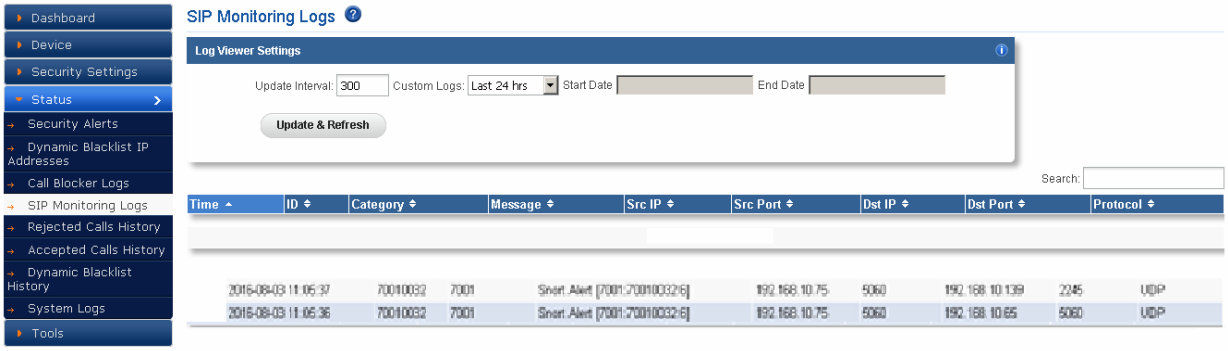

Figure 39: SIP Monitoring Logs

5.5. Rejected Calls History

This page shows the information about the SIP calls that are rejected by the PBX deployments protected by SIPFW.

The user also can choose to view the events that occurred in the selected time period.

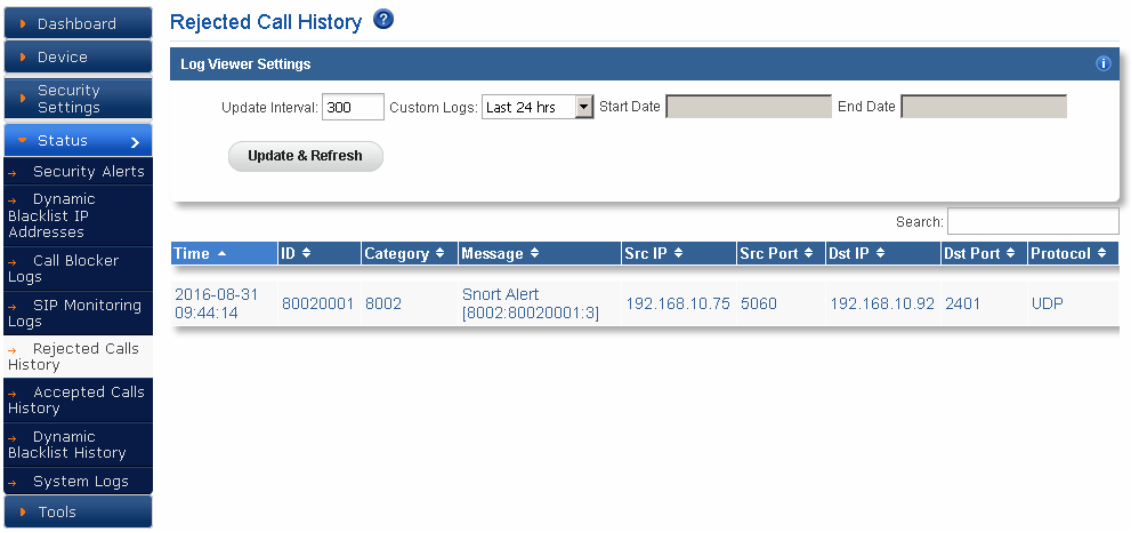

Figure 40: Rejected call History

5.6. Accepted Calls History

This page shows the information about the SIP calls that are accepted by the PBX deployments protected by SIPFW.

The user also can choose to view the events that occurred in the selected time period.

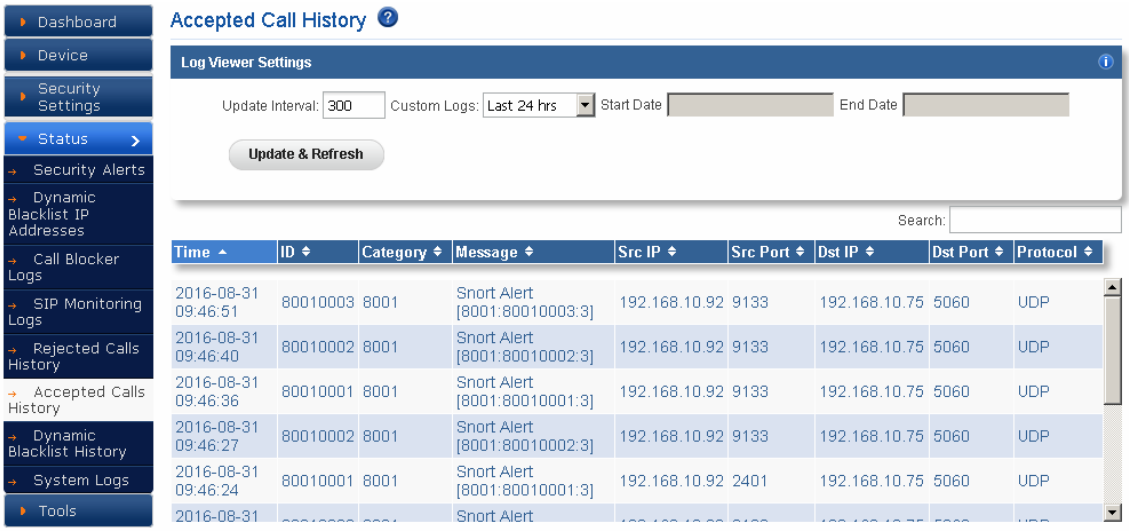

Figure 41 Accepted call History

5.7. Dynamic Blacklist History

This page shows the historical report on dynamically blacklisted ip addresses.

The user also can choose to view the events that occurred in the selected time period.

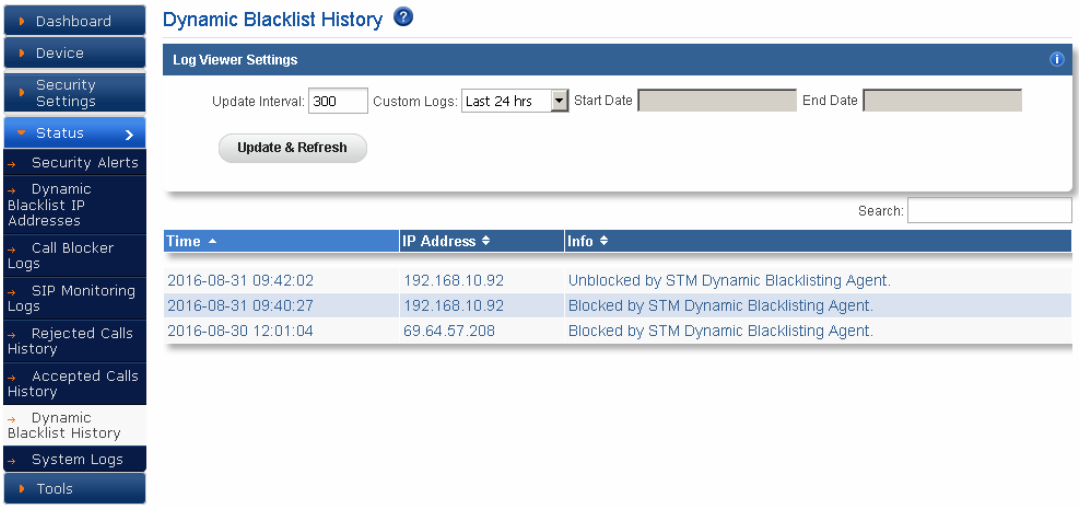

Figure 42: Dynamic Blacklist History

5.8 .System Logs

It shows logs with messages of particular module, logs time stamps and network status.

Log Viewer Settings

Update Refresh Interval- Users can Update & Refresh the page interval.

Refresh- click refresh button, to update the displayed messages and to reflect the most recent changes to a system logs being viewed.

Download Logs- User can have the option to download the security alerts shown in this page in CSV format is available on the page. Search- You can check the Log messages that you have created and also search by mentioning the system log names in the search tab. Particular log can search by making use of Search field

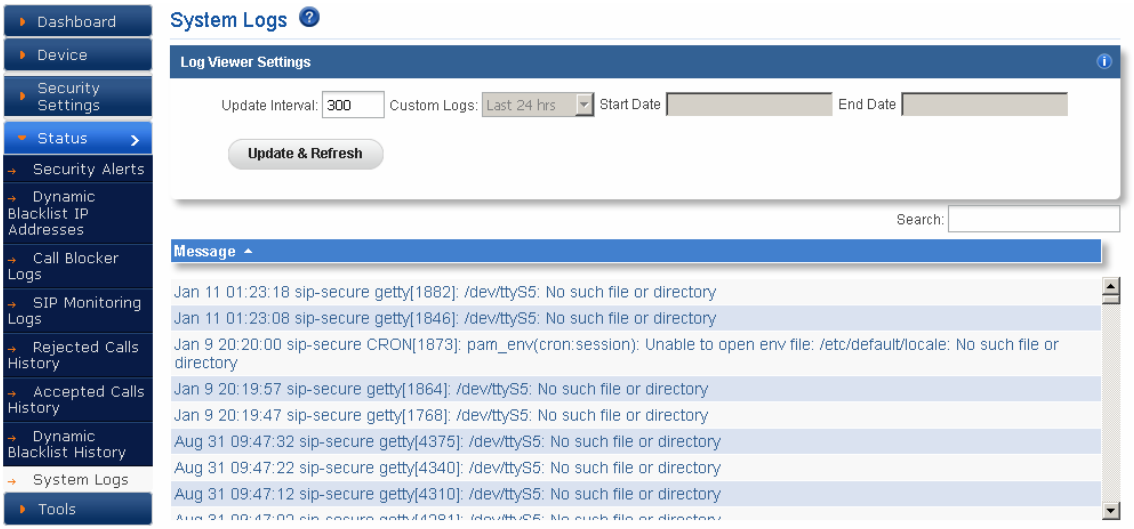

Figure 43: System Logs

Tools

6. Tools

6.1. Administration

Navigate through **Tools**> **Administration**

The Administration user interface page provides the option for running a factory reset on the device, restarting the device, device reboot, device shutdown & Configuration backup/restore.

Running factory-reset on the device requires reboot, thus the administrator will be redirected wait notification page on clicking the factory reset button and will be prompted login once the device comes up with the default configuration.

The SIP Firewall appliances support taking the configuration backup and restore the configuration later.

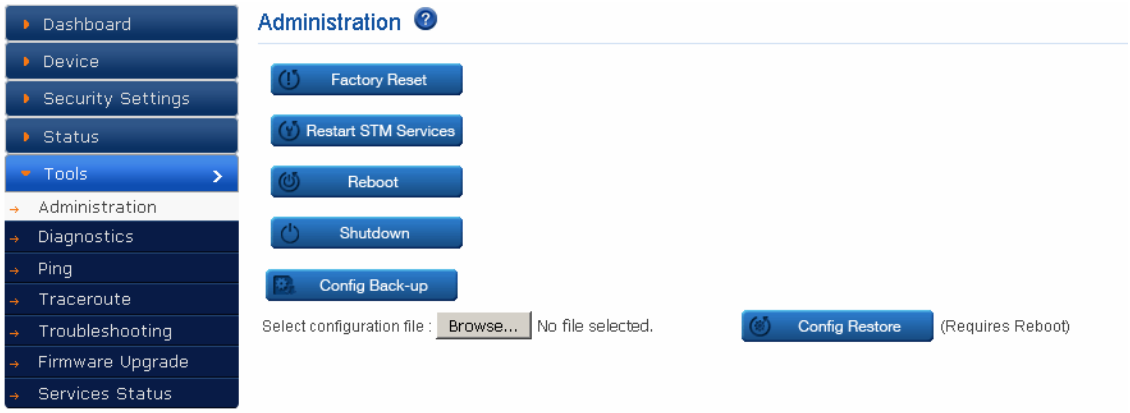

Figure 44: Administration

The configuration backup will contain the lastly persisted configuration, if there are any transient changes that are yet to be applied while taking the backup; those configuration changes will not be included in the configuration backup archive.

6.2. Diagnostics

Navigate through **Tools**> **Diagnostics**

The diagnostics page will allow the administrator to gather the troubleshooting logs which will help Allo Support team in debugging any issues faced with SIP Firewall deployment setup.

To run the utility on the device, the administrator needs to click the 'Run diagnostics' button. The device will run the diagnostics task in the backend and display the results once the task is complete. The administrator can download the reports by clicking the 'Get Report' button and send the report to Allo Support team.

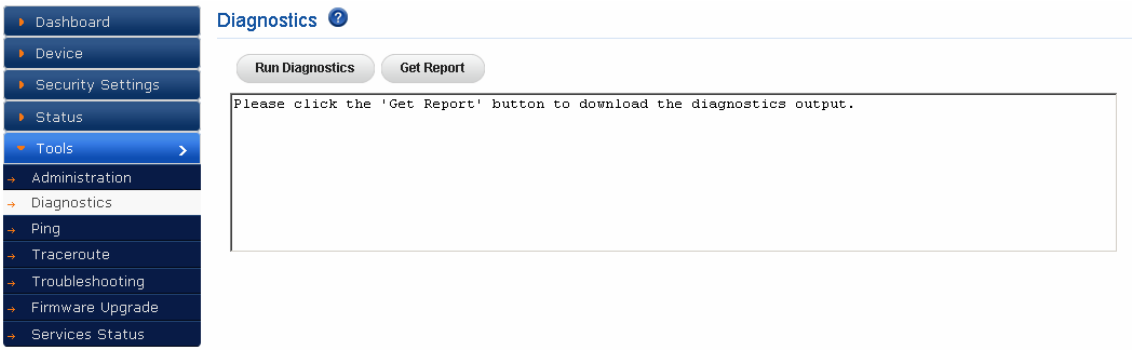

Figure 45: Diagnostics

Click the above link to download the diagnostics.

Figure 46: Download Report

6.3. Ping

Navigate through **Tools**> **Ping**

The administrator can troubleshoot the network connectivity issues with running ping from the SIP Firewall device.

The administrator needs to enter the IP address that needs to be pinged from the SIP Firewall appliance/ping count and click the 'Ping' button to run the task. The ping results will be displayed in the text area once the ping task is complete.

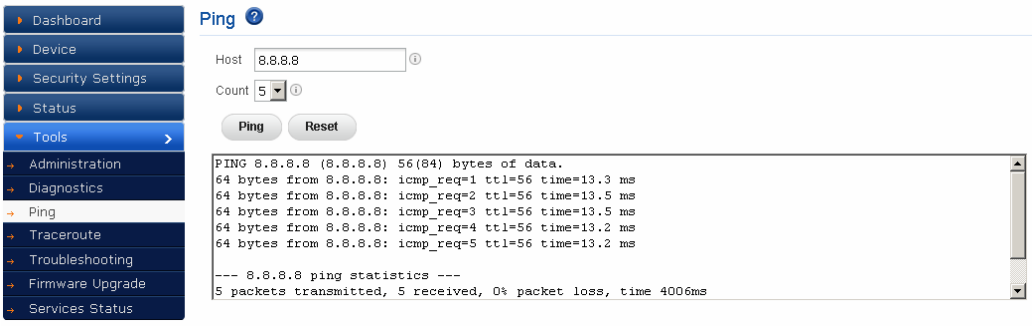

Figure 47: Ping Result

6.4. Trace route

Navigate through **Tools**> **Trace route**

The administrator can troubleshoot the network connectivity issues with running a trace route from the SIP Firewall device.

The administrator needs to enter the IP address to which the route needs to be traced from the SIP Firewall appliance/hop count and click the 'Trace route' button to run the task.

The trace route results will be displayed in the text area once the trace route task is complete.

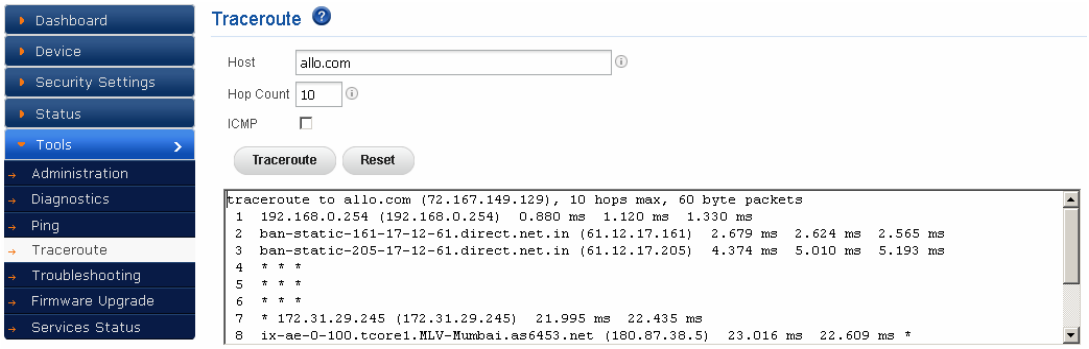

Figure 48: Trace route

6.5. Troubleshooting

Navigate through **Tools**> **Troubleshooting**

This page will allow disable/enable the DPI on the SIP Firewall appliance for troubleshooting purposes.

Figure 49: Troubleshooting

6.7. Firmware Upgrade

Navigate through **Tools**> **Firmware Upgrade**

The SIP Firewall appliance supports the manual upgrade on the SIP Firewall firmware running on the appliance. The firmware upgrade page shows the currently running SIP Firewall firmware version and allows the administrator to upload the firmware update package onto the device and install.

To install the firmware,

- Download the SIP Firewall firmware update package from Shield website and keep it your local system.
- From the browser on your local system, login to SIP Firewall WebUI and launch the SIP Firewall firmware upgrade page.
- Click the 'Browse' in the firmware page and select the SIP Firewall firmware update package file that you saved on your local system.
- After selecting the file, click the 'Upgrade' button.
- The device will verify the firmware uploaded and install. After install the device will reboot and administrator will be redirected the login page.

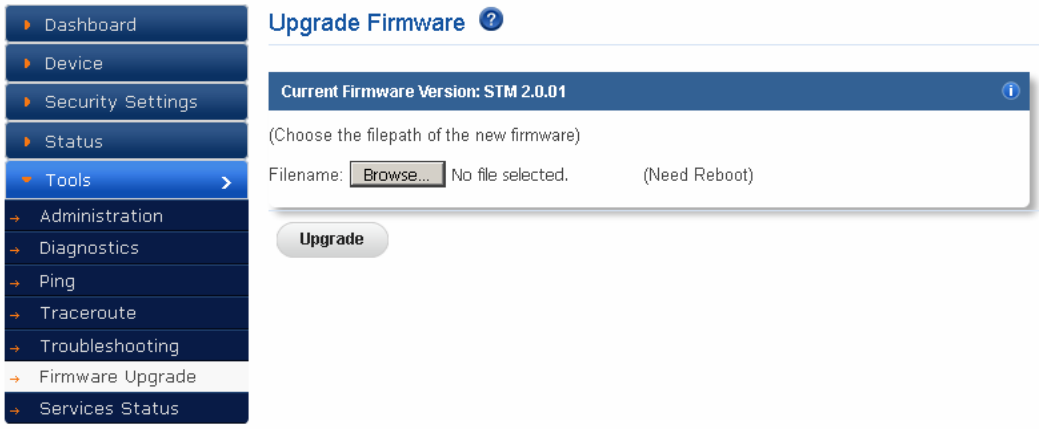

Figure 50: Upgrade Firmware

6.7. Service status

Navigate through Tools> service status

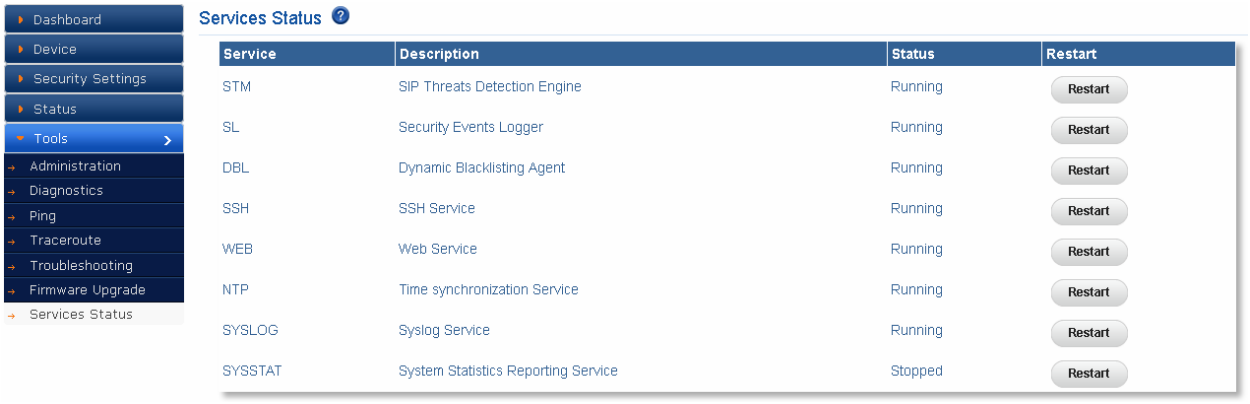

Figure 51: service status

FAQs

7. Frequently Asked Questions (FAQs)

What are SIP Threat Management (SIP Firewall) devices?

SIP Firewall is an approach to security management that allows an administrator to monitor and manage a wide variety of security-related applications and infrastructure components through a single management console. SIP Firewall devices combine an Intrusion Prevention System (IPS), Firewall into a single hardware platform.

What is a Network Security? How SIP Firewall gives security to Network?

Network security consists of the provisions and policies adopted by a network administrator. It is to prevent, monitor unauthorized access, misuse, modification, or denial of a computer network and network-accessible resources. SIP Firewall gives security to internal network by making use of Firewall, IPS (Intrusion Prevention System) etc.

What are the advantages of SIP Threat Management?

SIP Threat Management is a cost-effective solution to integrate multiple features into a single appliance.

I. Easy to configure
II. Less time used for maintenance
III. Better performance
IV. Cost Effective

What does SIP Threat Management Include?

SIP Threat Management includes the following features

1. Firewall
2. IPS (Intrusion Prevention System)
3. Network QoS
4. Bandwidth Control

Glossary

8. Glossary

Term	Definition
DoS *(Denial of Service)*	DoS are an attempt to make a machine or network resource unavailable to its intended users.
DDos *(Distributed Denial of Service)*	DDOS is a type of DOS attack where multiple compromised systems which are usually infected with a Trojan are used to target a single system causing a Denial of Service (DoS) attack.

Term	Definition
RTP *(Real Time Transport Protocol)*	RTP defines a standardized packet format for delivering audio and video over IP networks
RTCP- *Real-time control protocol*	The RTP Control Protocol (RTCP) is a sister protocol of the Real-time Transport Protocol (RTP). Its basic functionality and packet structure is defined in RFC 3550. RTCP provides out-of-band statistics and control information for an RTP session.
BPS*- Bit Per Second*	Its abbreviated bps or bit/sec is a common measure of data speed for computer modems and transmission carriers.
SSH*- Secure SHell*	It's a UNIX-based command interface and protocol for securely getting access to a remote computer.
DSCP - Differentiated Services Code Point	DSCP is a field in an IP packet that enables different levels of service to be assigned to network traffic. This is achieved by marking each packet on the network with a DSCP code and appropriating to it the corresponding level of service.
QoS -Quality of Service	QoS is the idea that transmission rates, error rates, and other characteristics can be measured, improved, and, to some extent, guaranteed in advance.
HTTP *-Hyper Text Transport Protocol*	It works on TCP protocol & Port number is 80. It's an application protocol for distributed, collaborative, hypermedia information systems. HTTP is the foundation of data communication for the World Wide Web. Hypertext is structured text that uses logical links (hyperlinks) between nodes containing text.
HTTPS *-Hyper Text Transport Protocol over Secure Socket Layer*	It makes more difficult for hackers, the NSA, and others to track users. The protocol makes sure the data isn't being transmitted in plain-text format, which is much easier to eaves drop on.
NTP *- Network Time Protocol*	It is a networking protocol for clock synchronization between computer systems over packet-switched, variable-latency data networks.
DNS*- Domain Name*	DNS are the Internet's equivalent of a phone book. They maintain a directory

Term	Definition
Server	of domain names and translate them to Internet Protocol (IP) addresses. This is necessary because, although domain names are easy for people to remember, computers or machines, access websites based on IP addresses.
***SIP**-Session Initiation Protocol*	It is a signaling communications protocol, widely used for controlling multimedia communication sessions such as voice and video calls over Internet Protocol (IP) networks.
***DHCP**- Dynamic Host Control Protocol*	It is a standardized network protocol used on Internet Protocol (IP) networks for dynamically distributing network configuration parameters, such as IP addresses for interfaces and services.
***FTP**- File Transfer Protocol*	It is a standard network protocol used to transfer computer files from one host to another host over a TCP-based network, such as the Internet. FTP is built on client-server architecture and uses separate control and data connections between the client and the server.
TFTP- Trivial File Transfer Protocol	It's a simple, lock-step, file transfer protocol which allows a client to get from or put a file onto a remote host. One of its primary uses is in the early stages of nodes booting from a Local Area Network.
***SMTP** - Simple Mail Transfer Protocol*	A protocol for sending e-mail messages between servers. Most e-mail systems that send mail over the Internet use SMTP to send messages from one server to another; the messages can then be retrieved with an e-mail client using either POP or IMAP.
***SSL** - Secure Socket Layer*	This is the standard security technology for establishing an encrypted link between a web server and a browser. This link ensures that all data passed between the web server and browsers remain private and integral.
***IP** - Internet Protocol*	It's a set of rules governing the format of data sent over the Internet or other network. The Internet Protocol (IP) is the method or protocol by which data is sent from one computer to another on the internet. Each computer (known as a host) on the Internet has at least one IP address that uniquely identifies it from all other computers on the Internet.

Term	Definition
MAC *- Media Access Control*	This is one of two sub layers of the Data Link Control layer and is concerned with sharing the physical connection to the network among several computers.
ICMP *- Internet Control Message Protocol*	It is one of the main protocols of the Internet Protocol Suite. It is used by network devices, like routers, to send error messages indicating, for example, that a requested service is not available or that a host or router could not be reached.
IMAP*- Internet Message Access Protocol*	IMAP is a protocol for e-mail retrieval and storage.
POP3*- Post office Protocol version 3*	It's a standard protocol for retrieving e-mail. The POP3 protocol controls the connection between a POP3 e-mail client and a server where e-mail is stored. The POP3 service uses the POP3 protocol for retrieving e-mail from a mail server to a POP3 e-mail client.
TCP *- Transmission Control Protocol*	It is a standard that defines how to establish and maintain a network conversation via which application programs can exchange data. TCP works with the Internet Protocol (IP), which defines how computers send packets of data to each other. Together, TCP and IP are the basic rules defining the Internet.
UDP *- User datagram protocol*	It is a communications protocol that offers a limited amount of service when messages are exchanged between computers in a network that uses the Internet Protocol (IP). UDP is an alternative to the Transmission Control Protocol (TCP) and, together with IP, is sometimes referred to as UDP/IP.
TCP/IP*- Transmission Control Protocol/Internet Protocol*	This is the suite of communications protocols used to connect hosts on the Internet. TCP/IP uses several protocols, the two main ones being TCP and IP.
LAN *- Local Area Network*	This is a group of computers and associated devices that share a common communications line or wireless link. Typically, connected devices share the resources of a single processor or server within a small geographic area.

Term	Definition
WAN *- Wide Area Network*	It's a geographically dispersed telecommunications network. The term distinguishes a broader telecommunication structure from a local area network.

Appendix

9. Appendix A – Using Console Access

1. Connect the serial console the serial port of SIP Threat Manager device.
2. Use the following serial console settings to access the CLI
   i. Speed : 115200
   ii. Parity : None
   iii. Data : 8
   iv. Stop bits : 1
   v. Flow control: No
3. The user should see the 'shield' command prompt on the terminal
4. Type 'help' to view the list of troubleshooting commands available.

10. Appendix B – Configuring SIP Firewall IP Address via Console

The user can choose to view/set the IP address of the SIP Firewall device allo>show IP

Now you can access the device from the browser using the URL https://<device-ip>

If you are not running the DHCP server in your deployment OR device fails to acquire the IP address, set the IP address from the console CLI using the command line.

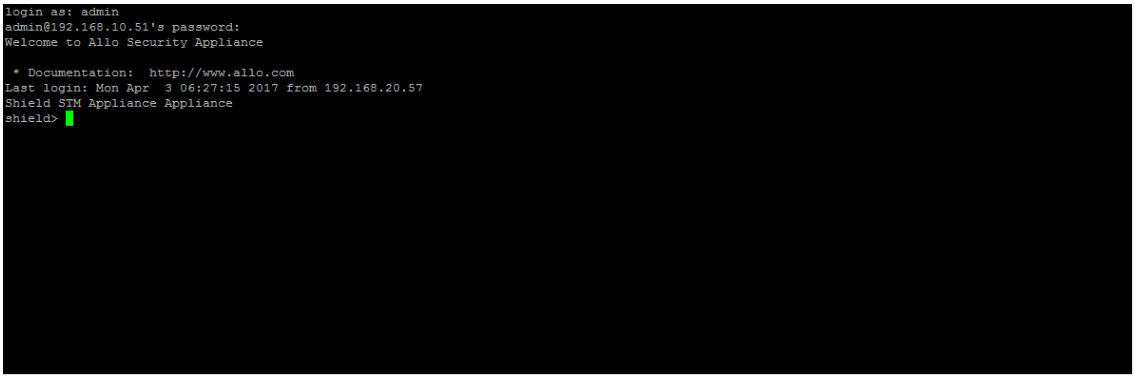
Elastix™ > Set IP < IP address><mask><gateway>

Verify the address using the 'show IP' command. Then use this IP address, to access the WebUI/SSH to configure the device for further configuration.

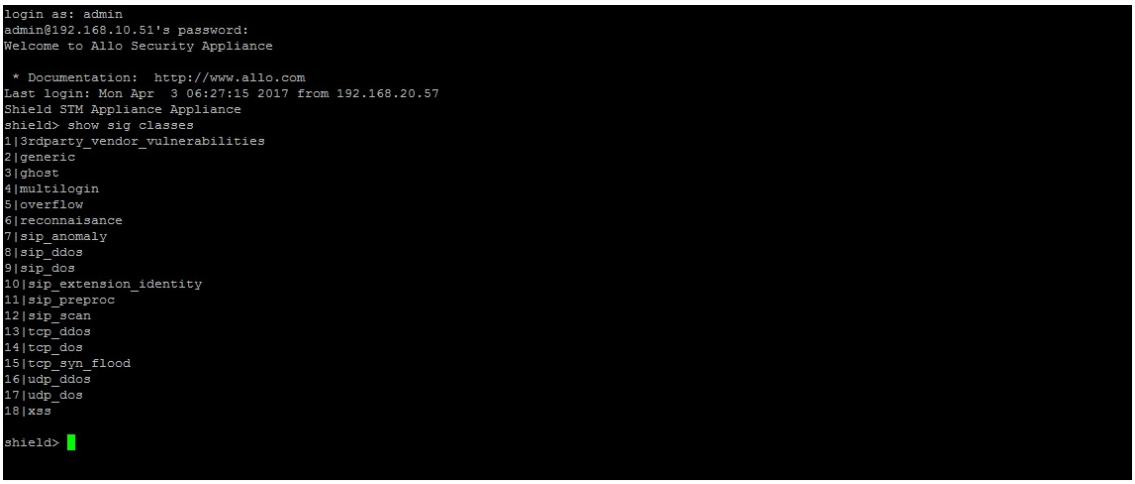
11. Appendix C – Enable/Disable Signatures via Console

The user can Enable/Disable the signatures of the SIP Threat Manager via Console

Login to the console as admin



Enter the command “show sig classes” to display the signature classes in the SIP Threat Manager



User can enter the command “show sig info sip_anomaly” to display the signatures in the particular class sip_anomaly class chosen in this case

```
shield> show sig info sip_anomaly
udp|70030001|Sig: Asterisk invite malformed SDP denial of service attempt
tcp|70030002|Sig: OPTIONS message Call-ID header request misplaced - after terminating newline
tcp|70030003|Sig: Attribute header rtpmap field invalid payload type
udp|70030004|Sig: Connection header invalid value
tcp|70030005|Sig: Time header contains long value
tcp|70030006|Sig: Time header contains negative value
tcp|70030007|Sig: Media header port field invalid value
tcp|70030008|Sig: Remote-Party-ID header hexadecimal characters in IP address field
tcp|70030009|Sig: Authorization header invalid characters in response parameter
tcp|70030010|Sig: Date header invalid characters detected
udp|70030011|Sig: Date header invalid characters detected
tcp|70030012|Sig: Content-Type header invalid characters detected
tcp|70030013|Sig: Content-Type header format string attempt
tcp|70030014|Sig: Contact header missing terminating quote
udp|70030015|Sig: Contact header missing terminating quote
tcp|70030016|Sig: Contact header unquoted tokens in field attempt
udp|70030017|Sig: Contact header unquoted tokens in field attempt
tcp|70030018|Sig: Contact header whitespace in field attempt
udp|70030019|Sig: Contact header whitespace in field attempt
tcp|70030020|Sig: Contact header format string attempt
udp|70030021|Sig: Contact header format string attempt
tcp|70030022|Sig: Contact header invalid characters detected
tcp|70030023|Sig: Contact header format string attempt
tcp|70030024|Sig: Call-ID header multiple Call-ID headers
udp|70030025|Sig: Call-ID header multiple Call-ID headers
tcp|70030026|Sig: Call-ID header invalid seperators
udp|70030027|Sig: Call-ID header invalid seperators
tcp|70030028|Sig: Call-ID header format string attempt
udp|70030029|Sig: Call-ID header format string attempt
tcp|70030030|Sig: Call-ID header invalid characters detected
tcp|70030031|Sig: Call-ID header format string attempt
tcp|70030032|Sig: Expires header invalid characters detected
tcp|70030033|Sig: Subject header format string attempt
udp|70030034|Sig: Subject header format string attempt
tcp|70030035|Sig: To header multiple To headers
udp|70030036|Sig: To header multiple To headers
```

As an example if user wants to disable the 'Content-Type header format string attempt' he can enter the command "disable sig <sig_id>"

Eg: shield> disable sig 70030013

```
shield> disable sig 70030103
sip_anomaly|udp|70030103|Sig: CSeq header format string attempt  (y/N)? y
disabled sip_anomaly|udp|70030103|Sig: CSeq header format string attempt

shield>
```

Once the user confirms the disabling of the signature the signature will get disabled

After disabling the signature user needs to Disable/Enable the dpi for the changes to take place

User can do it through Console using the commands "disable dpi" and "enable dpi"

```
shield> disable dpi

shield> enable dpi
Enabling DPI....

shield>
```
